# BIBLIOGRAPHY ON COLD REGIONS SCIENCE AND TECHNOLOGY Volume 34, 1980

# **INTRODUCTION**

The Bibliography on Cold Regions Science and Technology was first published in 1951 and is a continuing publication of the Cold Regions Bibliography Project in the Science and Technology Division of the Library of Congress. It is sponsored by and prepared for the Cold Regions Research and Engineering Laboratory (formerly Snow, Ice and Permafrost Research Establishment) of the U.S. Army Corps of Engineers. Volumes 1–15 were issued as the Bibliography on Snow, Ice and Permafrost, SIPRE Report 12. Beginning with volume 16 the designation was changed to CRREL Report 12. With volume 20 the title was changed to Bibliography on Snow, Ice and Frozen Ground, with Abstracts, and with volume 23 the current title was adopted.

The present volume contains material accessioned between October 1979 and September 1980. It contains the full citation of 4255 items, in many cases with abstracts. Pt. 2 is an index section divided into author and subject indexes. In the author index principal and joint personal and corporate authors are listed along with the title, date, pagination, and language of the document and the accession number. The subject index is composed of three basic elements: 1) terms taken from a controlled vocabulary based on the *Thesaurus of Engineering and Scientific Terms* (LEX-E JC), 2) free terms added as needed, 3) geographic names, generally entered under countries. The terms are listed in a single alphabetical arrangement, along with title (original, translated, abridged, expanded, or supplied), principal author, date, pagination, and language of pertinent documents, and their accession numbers.

This publication is the result of a coordinated effort. The bibliographic work was done by the Cold Regions Bibliography Project Staff who entered all data on a single computerized data base that accommodates both the Bibliography on Cold Regions Science and Technology and the Antarctic Bibliography, thus eliminating duplication of effort between the two bibliographies. The data processing, based on MARC II input, was handled by the Library's Automated Systems Office and the photocomposition by the Cataloging Distribution Service.

p.103-110, 24 refs.
Soil microbiology, Cold tolerance. Taiga, Supercool-

Ing.

The objectives of the present study were to determine the degree of cold tolerance as exemplified by individual supertooling points, of prominent species of soil and litter dwelling microarthropods in a forest habitat in central Aluska, and to examine the effects of body water content, season and hence environmental temperature, on their ability to supercool. All arthro-

pods tested were susceptible to freezing, and the mites utilize supercooling to avoid freezing. Reference is made to studies of supercooling in antarctic terrestrial arthropods.

Three soil profiles from Elephant Island, South Shetland Islands.

O'Brien, R.M.G., et al, British Antarctic Survey. Bulletin, Mar. 1979, No.47, p.1-12, 23 refs. Romans, J.C.C., Robertson, L. Soil profiles, Continuous permafrost, Soil composition, Weathering, Elephant Island.

tion, Weathering, Liephant Island.

Three soil profiles from ice-free areas around the periphery of Elephant Island are described and discussed. All three sites are underlain by continuous permafrost and the time interval since exposure to subaerial weathering and leaching is believed to range from several hundred years to about 10,000 yr. Incipient profile-horizon differentiation is just detectable on the oldests site but all three profiles show very little evidence of mineral weathering. (Auth.)

Antarctic fast-ice food chain: observations on the interaction of amphipod *Pontogeneia antarctica* Chevreux with ice-associated micro-algae.

Algae, Fast ice, Sea ice, Ecology.

Whitaker, 1.M.

Algae, Fast ice, Sea ice, Ecology.

Sea ice provides a great variety of sites for micro-algal growth. During winter 1973, observations were made on the colonization of the coastal ice foot at Signy Island and on the feeding habits of Pontogeneia antarctics Chevreux associated with the micro-algal growth. Samples of amphipods and micro-algae were taken using SCUBA diving techniques. The ice-associated micro-flora started development in early June with extensive growth of the blue-green algae Phaeocystis antarctics Karsten. This was replaced, mainly by diatoms, with Navicula glacie! Van Heurck and Nitzschia curta (Van Heurck) Haale predominant. With the formation of fast ice, the amphipod migrated from its summer habitat among the weed bed of the shallow water to the coastal tide-crack area. Here a protracted hatching release started in August and both young and some adults fed on the developing micro-algal flora of the ice foot. Pontogeneia antarctica seems to be non-selective, consuming detrital, algal or crustacean material within a broad range of particle size. This omnivorous feeding, combined with protracted hatching release and migration to the ice-associated food source present during the most winters, increases the probability that young will survive in a variable environment. (Auth.)

composition, Antarctica—Ross [ce Shelf.]
The annual fluxes of artificial radionuclides (Pu-239, Pu-239 + 240, Am-241, C5-137, Sr-90 and H-3) from the atmosphere to the Ross Ice Shelf in Antarctica were determined from measurements in strata data by Pb-210. Recognizable sources include the U.S. tests (Mike-Ivy and Castle Hill) in the early 1950s, the U.S. R. tests in the carly 1960s, the NNAP-9A burnup of 1964 and the French and Chinese tests in the late 1960s and 1970s. There are several problems still awaiting resolution: the differences in atmospheric chemistries of fission products and of transuranics produced in weapon tests and the anomalous fluxes of Pu-238 to the ice shelf which do not appear to reflect a one-year stratosphere residence. There is no evidence for a smearing of the fallout record as a consequence of diffusion of these radionuclides in the glacial column. (Auth.)

Wet snow, Snow compaction, Snow removal, Salinity. The compressibility of wet snow decreases with decreasing high water content but increases with decreasing salinity. Also, the tendency for snow splashing on highways increases with decreasing salinity. These opposite effects are complicated by the fact that houd water content and salinity are not necessarily independent. The amount of liquid present can be controlled somewhat by the toad grade, and salinity is generally determined by how much salt is applied to the road surface. For different situations it may be desirable to regulate salt applications in order to achieve a maximum amount of splashing with a minimum of compaction of wet snow into ice. Here we provide a qualitative review of wet snow and suggest how an understanding of wet snow's behavior on a road surface might increase our ability to deal with snow removal problems. Time-dependence enters into calculations of ice accretion on Time-dependence enters into calculations of ice accretion on objects primarily through terms dependent on the initial conditions and size and geometry of the object. A numerical technique to include the time-dependence is described here as well as simulation of complex situations where the conditions vary, for example, along a helicopter rotor blade. Some results of varying droplet sizes, velocity, and droplet distributions are presented. These indicate the general dependence of ice accretion on these parameters as well as illustrate the utility of numerical techniques in seeing how these effects can influence the rates of ice accretion for particular initial conditions.

Laboratory techniques, Ice accretion, Helicopters, Ice cover thickness, Temperature effects.

Ice cover thickness, Temperature effects. Experiments have been conducted to provide a basis for a computer model that simulates atmospheric ice accretion on a rotating blade. A comparison of the computer model simulation and experimental results reveals that general agreement exists within the temperature range 0 C to -25 C and the velocity range 0 to 60 m/s. Beyond 60 m/s the computer simulation over-predicts the thickness of the ice accretion at the leading edge. Below -25 C the simulation and experimental results disagree in that the simulation significantly overpredicts the thickness of the accretion at the leading edge.

Snow removal, Systems analysis.

The framework for a systems analysis of snow removal and ice control on roads is presented. Definition of the operating conditions, the principal ones of which are climate and traffic, as well as the system itself, the road net, is required. Equipment factors myolved in performing the basic functions of clearing, spreading, loading, and hauling are analyzed.

Snow removal, Computerized simulation, Environment simulation.

ment simulation.

A general computer model to simulate urban snow removal has been developed. One part of the package includes several programs which assist in the routing of snow removal vehicles using computer graphics. The primary element, however, is a program which, once specific vehicle routes are input, allows the simulation of any particular snow removal scenario. Parameters that can be varied include both truck and snowstorm characteristics. This simulation program is tested using truck routes and storm data from Newington. Connecticut. Results indicate that the simulation predicts plowing times quite reasonably.

Sea ice, Drift, Ice islands, Hummocks.

Patterns of sea are flow were surveyed aerally. The results were used to determine the effects of grounded are islands (known as "ice hummocks") on ice flow. Ice hummocks were found to change the direction and rate of flow in the surrounding area. "Straits" between ice hummocks were found to affect flow locally, but the density of ice hummocks in a given area was found to be more important on a large scale. Ice hummocks are found to have significant effects on the flow of sea new found to be more important on a large scale. Lee hummocks are found to have significant effects on the flow of sea ice, especially on velocity of flow

Construction and performance of membrane encapsulated soil layers in Alaska.

Smith, N. U.S. Army Cold Regions Research and Engineering Laboratory June 1979 CR 79-11, 27p. ADA-073 531, 17 refs.
Soil freezing, Cold weather tests, Frost protection, 531 water, Waterprooning, Trost neares.

Sil water, waterprooming, trost tiedee.

In 1973 two membrane encapsulated soil layer (MESL) test sections were constructed into existing gravel surfaced roads at Elimendorf AFB and at Ft. Wainwright in Anchorage and Fairbanks, Alaska, respectively—The Elimendorf AFB MESL contains a silty clay soil and the Ft. Wainwright MESL contains a nonplastic silt—Both sections were constructed at soil moisture contents of approximately 2% to 3% below optimum for the CE-12 compactive effort—There were no indications of soil moisture migration during freezing in either test section, and after-thaw field California Bearing Ratio values were nearly equal to values measured before freezing—There is growing evidence of a slight increase in the overall soil moisture content in the Elimendorf AFB MESL, possibly from moisture entering through the single layer polyethylene sidewalls which were not treated with asphalt emulsion. There is good evidence that the membrane of the same section might have received damage during a soil sampling operation which allowed localized moisture infiltration. A two-layer polyethylene membrane used in the Ft. Wainwright MESL is considered a more positive moisting the same section might are received damage during a soil sampling operation which allowed localized moisting through the same section might have received damage during a soil sampling operation which allowed localized moisting the Ft. Wainwright MESL is considered a more positive moisting through the same section might have received damage during a soil sampling operation which allowed localized moisting through the same section might have received damage during a soil sampling through the same section might have received damage during a soil sampling through the same section might have received damage during a soil sampling through the same section might have received damage during a soil sampling through the same section might have received damage during a soil sampling through the same section might have received damage during a soil sam ture infiltration. A two-layer polyethylene membrane used in the Ft Wainwright MESL is considered a more positive mois-ture barner than the single sheet and a justifiable added cost for permanent construction.

Freezing problems associated with spray irrigation of

wastewater during the winter.
Bouzoun, J.R., U.S. Army Cold Regions Research and Engineering Laboratory. May 1979, SR 79-12, 12p., ADA-070 031, 5 refs.

Waste treatment, Water treatment, Waste disposal, Irrigation, Ice prevention.

Irrigation, Ice prevention.

During the winters of 1975-76, 1976-77 and 1977-78, biologically treated wastewater was applied to land in West Dover, Vermont. The wastewater was applied using the spray irrigation method at ambient temperatures as low as OF. During the first winter freezing was a major roblem. Modified gard notzles that were less susceptible to freezing were installed at both the low points and high points of the aboveground spray laterals. During the second and third winters, ice buildup nozzles, caused serious damage to the pipes. Many man-hours

were required to cut the ice repeatedly from the laterals. As an experiment to alleviate the problem, several 30- to 36-in risers were installed at an angle of approximately 30 degrees from the vertical on two of the spray laterals during the winter of 1977-78. They functioned well enough to warrant future installation on the entire system of spray laterals.

Drainage network analysis of a subarctic watershed. Caribou-Poker Creeks research watershed, interior Alaska.

Bredthauer, S.R., et al. U.S. Army Cold Regions Re-79-19, 9p , ADA-073 595, 14 refs.

Hoch, D.

Watersheds, Drainage, Slope processes, Permafrost. Watersheds, Irrainage, Slope processes, Permafrost. A Strahler stream order analysis and an exterior link length distribution analysis were made of the Carbou-Poker Creeks Research Watershed near Fairbanks, Alaska. The drainage network map used for analysis was produced using a 12250 scale aerial photograph mosaic. Low drainage densities characterize the basins. Bifurcation ratios indicate that the overall drainage network is not dominated by strong geologic controls Statistical analysis indicates that bifurcating source links and tributary source links on not belong to the same length population, a characteristic shared by watersheds in other climatic regions of the world. Additional analysis indicates that exterior links originating on permafrost slopes tend to be shorter terior links originating on permafrost slopes tend to be short than those originating on non-permafrost, well-drained slope

Infrared thermography of buildings: 1977 Coast Guard survey.

Marshall, S.J., U.S. Army Cold Regions Research and Engineering Laboratory, June 1979, SR 79-20, 40p., ADA-073 596, 9 refs.

Buildings, Heat loss, Infrared photography, Win-

dows.

An IRTB (infrared thermography of buildings) field survey, producing 6.31 thermograms, 12° photographs, and weather data, was conducted during a 14-day study of 10 Coast Guard stations in Maine, New Hampshire and Massachusetts. This report discusses how the survey was initiated and performed with emphasis on details for the benefit of the reader wishing to plan a survey. One hundred twenty selected thermograms and photographs in this report illustrate many types of heat loss and compare thermally ineffective doors and windows with units designated as standards for thermal effectiveness. Radiator heat leakage through walls, motified moisture patterns on piack walls, infiliration patterns on glass, and poorly covered openings are illustrated. Thermograms of severe heat losses through glass doors, glass transoms, and glass wall panels are also included, and several solutions for individual heat loss problems, such as fiberglass garage doors and percelant misulated panels, are suggested. Unanticipated survey problems, such as fiberglass garage doors and percelant misulated panels, are suggested. Unanticipated survey problems, such as difficulties in obtaining photographs to compare with

vey techniques for inclement weather, are also discussed

Application of heat pipes on the Trans-Alaska Pipe-

Heuer, C.E., U.S. Army Cold Regions Research and Engineering Laboratory, July 1979, SR 79-26, 27p., ADA-073 597, 26 refs.

Pipelines, Heat pipes, Heat transfer.

Pipelines, Heat pipes, Heat transfer.

The application of heat pipes on the Trans-Alaska Pipeline is reviewed. The subjects addressed include the general functioning of a heat pipe, the specific heat pipe design used, the different situations where heat pipes were employed, the methods used to develop the heat pipes design, the methods used to monitor the operating heat pipes, and the performance of the heat pipes. The discussion is qualitative in nature. Quantitative information is largely omitted to allow coverage of a broad area and because it may be considered proprietary. Nevertheless, the information presented here should give a good appreciation of the quality and complexity of the heat pipe design. The information should also be useful in developing heat pipes for use in other cold regions applications. for use in other cold regions applications

Ocean ice.

Sobey, E., Sea frontiers, Mar.-Apr. 1979, 25(2), p.105-

114.

Sea ice, Ice salinity, Climatology, Icebergs.

Written for the general reader, this article points out the tremendous importance of antarctic and arctic ice. Icebergs are discussed, especially as a potential source of freshwater, and the differences between arctic and antarctic icebergs explained Photographs compare the jagged and tabular types of bergs More general and far-reaching differences in the two polar regions are also contrasted and their influence on world climate tressed. The propose by which sen jice loss salt as it freezes. stressed. The process by which sea ice loses salt as it freezes explains the relatively low salinity of ice formed from sea water.

Remote sensing in glaciology and the physics of

Nye, J.F., Remote sensing of the terrestrial environment, edited by R.F. Peel et al. Symposium of the Colston Research Society, 28th, University of Bristol, 1976, Proceedings, London, Butterworths. April 5-9 1976, Proceedings, London, Butterworths, 1977, p 189-197, 24 refs DGS 753 7 R228t

Ice sheets, Radio echo soundings, Remote sensing.

Ice sheets, Radio echo soundings, Remote sensing. The many applications of remote sensing that are now being used in glaciology are briefly mentioned, detailed accounts of most of them are conveniently available in a recent conference volume. The most highly developed application is the echo sounding of Greenland and Antarctic masses by radio pulses. After referring to the successes and potentialities of this technique, the chapter describes current experimental and theoretical work at Bristol on the topic. A radio echo has a detailed structure both of amplitude and of phase, it is a pattern in the dimensions, moving upwards and changing with time as it goes it can be observed with the aid of a laboratory analogue machine that uses ultrasoonic pulses in place of radio pulses. A conspicuit can be observed with the aid of a laboratory analogue machine that uses ultrasonic pulses in place of radio pulses. A conspicuous feature of the pattern is a complicated array of looped lines, called dislocations, along which the amplitude is zero and the phase is indeterminate. They are analogous to the dislocations found in crystals. A comprehensive theory of the scattering of pulses by a rough ways surface, or other scattering object, which seems essential to a full understanding of active remote sensing, does not yet exist. One of the features it has to take into acdoes not yet exist. One of the features it has to take into ac-count is the imperfect focusing of the echoes on to causti-surfaces and the relation between these surfaces and the disloca-tion lines. (Auth. mod.) does not yet exist

Studies of ice by means of radio echo sounding.

Gudmandsen, P., Remote sensing of the terrestrial environment, edited by R.F. Peel et al, Symposium of the Colston Research Society, 28th, University of Bristol. Apr. 5th to 9th, 1976, Proceedings, London, Butterworths, 1977, p.198-211, 19 refs. DSG 753.7 R228T

Ice sheets, Radio echo soundings, Ice electrical properties.

erties.

This paper gives a review of the airborne radio echo-soundings carried out in Greenland by the Technical University of Denmark (TUD). The technique is described by means of illustrations with emphasis placed on a qualitative interpretation of the phenomena observed and the uncertainties and limitations of the technique. Radio echo sounding of the Antarctic ice sheet is also noted. (Auth. mod.)

Sergin, V.IA., Journal of geophysical research, June 20, 1979, 84(C6), p.3191-3204, 22 refs.
Ice sheets, Ice models, Climate, Mathematical mod-

els, Computerized simulation.

In order to carry out a study of the origins and thermodynamic mechanisms of the large-scale climate oscillations and glacuations of the earth which have occurred over the last few hundred thousand years, a simplified thermodynamic model of the glaciers-ocean-atmosphere global system is constructed. The dytriousand years, a simplified intermodynamic model of the gla-ciers-ocean-stmosphere global system is constructed. The dy-namics of the system are analyzed by computer, and the pertur-bations due to deviations of the earth's orbit and to tectonic forces are examined. The characteristic regimes of the system are auto-oscillations, which exist with realistic numerical values of all parameters. The calculated variations in the mean tem-perature of both hemispheres, the temperature differences be-tween the equator and pole, the sizes of marine and continental rec covers, the ocean level, and other values are of the same order of magnitude as those of empirical data. The transition from a relatively warm epoch (when continental ice sheets are absent) to conditions characteristic of the Pleistocene is mod-eled. The calculated curves show how weak temperature fluc-tuations are succeeded by large-scale oscillations. Thus the simulation results not only provide an answer to the question concerning the cause of oscillations in the earth's climate and glaciation during cold epochs, but they also explain the absence of oscillations during warm epochs: in the absence of the second inertial link (continental ice) the system is essentially aperiodic. Variations in the antarctic ice sheet are examined.

Sea ice, Dynamic properties, Ablation, Ice accretion, Thickness, Water temperature, Thermodynamics, Heat flux, Wind factors, Mathematical models. This work describes the construction of and results from a numerical model simulating the yearly cycle of sea ice in both the northern and southern hemispheres. Both thermodynamic and dynamic processes are incorporated. The model simulates a reasonable yearly cycle of sea ice thickness and extent in both the Arctice and Antarctic. In the Antarctic, he ice expands from a minimum in March to a maximum in late August, remaining close to the continent in the former month and extending northward of 608 in the latter month. Maximum thicknesses are about 1.4 m. Modeled ice concentrations correctly reveal a more compact ice cover in the northern hemisphere than in the southern. In the Antarctic, simulated velocities reveal predominantly westerly motion north of \$88, with smaller scale cyclonic motions closer to the continent.

Radio echo soundings. Ice sheets, Sea ice.

Radio echo soundings, Ice sheets, Sea ice. The activities of the Scott Polar Research Institute for the year ending Sep. 30, 1978 are summarized under the following topics: teaching and research, library and information service, international activities, finance, and lectures. In addition, publications, grants, visiting scholars, staff and research students, and gifts are listed. The principal achievements of the airborne radio echo sounding of polar ice sheets program were filling in gaps in the 100-m flightline network over east Antarctica and extending it westwards. The previous sounding grid over Marie Byrd Land was extended eastwards towards the Pensacola and Ellsworth mountains and ten glaciological profiles were flown over various areas. For the first time, simultaneous magnetic profiles were obtained on radio echo flights.

Snerves.

The meeting of the glaciology working group was held in Ottawa, Canada, Aug. 19-20, 1978. The national and international activities reported are briefly summarized. Field studies are being conducted by Argentina, Australia, Chile, France, Japan, Norway, USSR, United Kingdom and the United States. The Federal Republic of Germany plans to start geophysical

and glaciological studies in 1981. The international activities include the international and the Antarctic Peninsula glaciology projects, glaciological aspects of climate studies, a satellite inage atlas of glaciers, a world glacier inventory, a third antarctic glaciology symposium, satellite glaciology, radio echo sounding flights, ice sheef modelling a further conference on icebergs, and ice shelf and sea ice studies. The proceedings of the meeting also included elections, proposals for future meetings, and recommendations.

sea ice. Ice surface.

which is small the and a water should be a standard or a second of the same of

The empirical evidence singlests that all types of ice display linear elements that can be compared with lineaments in the earth's surface. The basic global jointing pattern of NE-SW and NW-SE appears to extend to sea ice, and ice-mavigation experience suggests that movement is easier along these courses while course subject to the N-S and E-W directions result more frequently in ships becoming incebound. Closer study of ice jointing patterns may thus offer new prospects for ice mayigation, especially in connection with the establishment of new high-latitude icebreaker routes. The linear relief elements of anitarctic sea ice and ice shelves, as well as ice cover in both the interior and marginal parts of the continent are discussed.

Mass budget of the Lambert Glacier drainage basin, Antarctica.
Allison, I., Journal of glaciology, 1979, 22(87), p 223-

35 30 refs

Glacier mass balance, Glacial hydrology, Ice shelves, Ice cover thickness, Glacier ablation, Antarctica— Lambert Glacier, Antarctica—Prince Charles Moun-

Estimates have been made of the mass budget of the total diamage basin of Lambert Glacter. These show a small but significant positive state of balance for the interior basin (the accumulation area up-stream of the major ice streams), and strongly suggest a positive balance for the Lambert Glacter system (the region of major ice streams), between the Amery Ice Shell and the interior basin). The total mass flux into the interior basin is estimated as 60 Gt a. Results are presented from a number of ice movement stations established between 1972 and 1974 around the perimeter of the southern Prince Charles Mountains. These results, together with ice thicknesses from radio echo-sounding in the area, give a total mass outflux through the colorism of the state of the southern Prince Charles Mountains. These results, together with ice thicknesses from radio echo-sounding in the area, give a total mass outflux through the contour of 30. Gt a, implying a budget excess of a further 30. Gt a over the whole interior basin. Results from relocity and ice thickness measurements give a mass discharge through a section near the junction of Lambert Glacter and the Amery Ice Shelf of 11 Gt a. Losses within the Lambert Glacter system proper account for a further? Gt a and an overall mass excess of 12 Gt a is estimated for the Lambert Glacter system. This present positive state of balance contrasts with geomorphological evidence from the southern Prince Charles, Mountains of a large drop in ice level in recent geological time, and the ice surface in the area may now be building up after a manut recession. (Auth.) Estimates have been made of the mass budget of the total drainand the ice surface in the area may now be building up after a major recession (Auth)

In-situ measurements of the activation energy for D.C. conduction in polar ice.

Bentley, C.R., Journal of glaciology, 1979, 22(87), p.237-246, 14 refs

Ice electrical properties, Ice shelves, Electrical resistivity, Ice models, Antarctica—Ross Ice Shelf.

tivity, Ice models, Antarctica—Ross Ice Shelf.

Electrical resistivity measurements were carried out at Station 19 on the Ross Ice Shelf where temperature measurements were available to a depth exceeding three-quarters of the thickness of the shelf. As in a previously published study at a point about 30 km up-stream (Bentley, 1977), the apparent resistivities fit well to a model based upon a steady-state ice shelf with zero bottom balance-rate and an apparent activation energy in the solid ice of 0.15 to 0.25 eV, with preference for the lower end of the range. This model also fits the observed temperature data almost perfectly. Causes of resistivity variation with depth other than the temperature, such as impurity content, metamorphic history, grain size, and crystal orientation, probably do not strongly affect the resistivity depth function. It is concluded that the true activation energy in the solid ice is less than 0.25 eV and perhaps as small as 0.15 eV, although a reduction by a factor of two or three in the ionic impurity concentration between 50 and 250 m depth cannot be entirely ruled out as a cause of the low apparent temperature effect. A note added in proof indicates that Heiron and a lower of the low apparent temperature effect. A note added in proof indicates that Heiron and a lower of the low apparent temperature effect. Ice shelves, Shear stress, Glacier tongues, Analysis

Ice shelves, Shear stress, Glacier tongues, Analysis (mathematics), Antarctica—Amery Ice Shelf.
Vertical shear stress in ice shelves cannot be precisely zero, since the upper and lower surfaces are generally not parallel Vertical shear stress is calculated for an unconfined glacier tongue and for a confined bay lice shelf, first, using the assumption of constant temperature and density with depth, and secondly, using realistic data and profiles for Erebus Glacier tongue and for the Amery Ice Shelf. Shear stresses increase almost linearly with depth, and are proportional to surface slope. For Erebus Glacier tongue the stear stress is at most 5% of the magnitude of the direct stress deviators and its action through the ice shelf should result in differential movement of 1.8 cm/a between the top and bottom of the ice shelf. For the Amery

Ice Shell, the shear stress is at most 0.4 of the magnitude of the direct stress deviators and this should lead to differential movement of 2.5 cm a between the top and bottom of the ice shelf. Shear stresses are therefore generally negligible in comparison with direct stress deviators and can be ignored when considering the overall dynamics of ice shelve. Differential movement is unlikely to be detectable. (Auth.)

orientation.

Six test roofs of two different slopes: 16.3 deg and 39.8 deg, and three different roof coverings: asphalt shingles, cedar shingles, and corrugated aluminum sheeting, were constructed at USACREEL, Hanover, New Hampshire, and were instrumented with thermocouples, heat flow meters, and calibrated the ship of the ship mented with thermocouples, heat flow meters, and calibrated gutters. Measurements were recorded for the winters of 1971-72 and 1972-73. The degree of long and the chromological changes in the snow cover were recorded on 35-mm Kodachrome shides. It was found that eave long is a sensitive function of the slope, roof covering composition, and solar radiation. The effects of wind were not investigated, the data were screened to remove all information corresponding to wind-speeds over 8 km/h. In order of increasing tendency to form the data with the continuous control of the control of the

Snow (construction material), Projectile penetration, Penetration tests.

Penetration tests.

Three types of ammunition, the M193, M80, and M43, were tested. Rounds were fired into snow targets of various thicknesses up to that thickness required to fully stop the projectiles. The maximum penetrations for the three rounds tested were 0.70 m. 1.26 m and 1.06 m, respectively. Velocity loss as a function of target thickness was determined by measuring proctile velocity before and after impact of the projectile with target. The velocity loss vs. thickness data showed a sigmoid shape common to the three types of rounds. The impact and exit yaw angles of the M193 rounds were estimated. Scatter in the test data was attributed, in part, to random variations in the impact yaw angle. The penetration required for a 90 deg yaw was determined by the exit yaw measurements. This was shown to correspond to the inflection point on the velocity loss vs. penetration curve. This point is potentially significant in the design of composite fortifications. Discussions deal with basic concepts and definitions, the occurrence and significance of projectile tumbling and the use of laboratory tests for small arms evaluation in snow targets. The validity of the methodology used was established by testing M193 rounds in gelatin largets. These results compared favorably with similar test results in literature. sults in literature

chanics.
Vialov, S.S., U.S. Army Cold Regions Research and Engineering Laboratory, May 1979, TL 716, 134p., ADB-039 069L, Distribution limited to U.S. Government agencies only. For the complete Russian book

Soil mechanics, Soil creep, Plastic deformation, Soil strength, Models, Analysis (mathematics).

Strength, Models, Analysis (mattematics). The book from which the three chapters in this translation are taken investigates principles of rheology in soil mechanics and bases its scientific principle on the relation of pressure change and volume, densification, and such properties of soil as internal friction, cohesion, and changes in structure and texture. Chapter 5 investigates forms of creep, deformation, residual deformation and the relation of stress, strain and time. The general forms of the creep flow equations are treated considering time

and rate variables. Experimental data are prometed. Chapter 7 investigates the mechanistic models of linear elastic-plastic concepts of ground deformation, arriving at a series of complicated concepts explaining shear creep. The chapter end with theoretical fundamentals of flow and creep based on nolecular-kinetic and thermoactive processes. Chapter 9 leads to field and laboratory strength tests of soil. Investigated are the conditions of load application and its influence upon test results. results. The important long-term strength equations are derived in detail. The chapter gives many concepts of strength variables, conditions and states which are immediately applicable in practice.

tarctica—Menzies, Mount.

Study of recent high quality stereoscopic color photography of the Southern Prince Charles Mountains, Australian Antarctic Territory, allows detailed reconnaissance mapping of geomorphology. One of the largest and southernmost nunataks of the area (around Mt. Menzies 3,228 m) was selected for detailed study. Features mapped include ice-cored moraines, moraine ridges, trim lines, thermokarst, colian and niveo-colian deposits, ice wedge polygons with raised crims, and ice wedge polygons with raised crims, and ice wedge polygons with raised crims, but the most extensive morphological type, occurring in continuous fields in the eastern half of the nunatak. Ice-covered forms are common around much of the nunatak margins, some being mantied with a sufficient thickness of debris cover to have acquired ice-wedge polygons. Moraine ridges above the present ice limits, but lacking evidence of an ice core occur over a wide altitudinal range. Many of these are related to higher stands of the surrounding mland ice, and provide evidence of former ice limits.

Effects of the annual migration of the antarctic packice border on cyclonic storm activity over the Southern Ocean.

Kachelhoffer, S.J., Madison, University of Wisconsin, 1973, 49p., Master's thesis. 16 refs. Unpublished manuscript.

Pack ice, Sea ice distribution, Meteorological factors. Pack ice, Sea ice distribution, Meteorological factors. Statistics of a number of characteristics of the cloud vortices associated with cyclonic storms in the 40-75S latitude belt have been compiled, based upon an evaluation of ESSA Southern Hemisphere musaic satellite photographs for the spring and fall seasons, when the pack-ice border is at its farthest equatorward and poleward positions. Analysis of the data shows a significant equatorward shift of the latitude of maximum frequency of storm occurrence in spring when compared to the fall season, which corresponds with the annual migration of the pack-ice border. The longitudinal distributions and directions of movement of cyclonic storms do not appear to be significantly afwhich the longitudinal distributions and directions of move-ment of cyclonic storms do not appear to be significantly af-fected. Results of an attempt to correlate the spring position of the pack-ice border with the spring latitudinal distribution of vortices in certain longitude sectors show an apparent, but not highly significant, relationship. Radioactive isotopes, Isotope analysis, Fallout,
Precipitation (meteorology), Antarctica—Amundsen-Scott Station.

Snew samples were taken from a 5-m-deep pit located near Amundsen-Scott Station in Jan. 1975, and continuous deuterium, tritium and beta activity profiles have been obtained from them. These three measurements and the stratigraphic level observation allow a precise chronology of the pit from 1950 to 1975 to be deduced, providing a continuous record of artificial tritum fall-out in the Southern hemisphere. This has been extended to 1978 using samples from a second pit taken in 1978. The beta and trittum peaks occur during the Antaretic summer and the Antaretic winter respectively, showing different injection mechanisms. The winter input and the high-tritum values registered at the Amundsen-Scott Station indicate a preferential intium transfer over the polar region. Two cate a preferential tritium transfer over the polar region—Two inechanisms, stratospheric-tropospheric exchange and direct stratospheric cloud precipitation, could account for this injec-

purities, Evaporation.

purities, Evaporation. A procedure is described for the preconcentration of very dilute solutions at the 1/1,000,000 microgram/g level by nonboiling evaporation in Telon bulbs in the presence of hydrofluoric and intric acids under clean room conditions. By processing various synthetic standards, calibration curves are determined by variable arnance statistical techniques for Na, Mg, K. Ca, Fe, Al, Mn, Pb, Cd, Cu, Zn, and Ag. The results of the analysis by this procedure of a typical snow sample collected at South Pole Station show that for most of the elements the precision is in the order of 10%. (Auth. mod.)

Determination of the stratospheric residence time from the total beta activity of antarctic and Greenland snows.

Pourchet, M., et al, Geophysical research letters, May 1979, 6(5), p.365-367, 9 refs. Pinglot, F.

Snow impurities, Radioactivity, Fallout, Stratosphere.

phere.

The beta-activity in polar snow reflects the combined effects of fallout from and radioactive decay in the stratospheric reservoir of nuclear debris, which has become virtually uniform since the last bomb tests in 1965. This makes it possible to estimate the stratospheric residence time from the decrease in the beta-activity of snow with age (depth). The residence times thus determined for Antarctica and Greenland average 1.63 years and are in good agreement with published estimates from atmospheric measurements. (Auth.)

Alkali and alkaline earth enrichments in aerosols deposited in antarctic snows.

Boutron, C., Atmospheric environment. 1979, Vol.13, p.919-924, 25 refs.

Snow composition, Snow impurities, Aerosols.

About 175 snow samples collected in various locations both in East and West Antarctica, using stringent contamination free techniques, have been analyzed for Na, Mg, K, Ca and Al by techniques, have been analyzed for Na, Mg, K, Ca and Al by flameless atomic absorption after preconcentration. Multiple linear regression analysis was used to calculate the enrichment factors for K, Ca and Mg in both the oceanic and the crustal components: no significant enrichments are found in antarctic snows, which suggests that the enrichments previously observed by Vosters (1971) and Boutron et al. (1972) could be linked with a contamination of the samples analyzed by these authors. This conclusion can probably be extended to antarctic aerosols, since their composition is very likely similar to that of snow, as shown at the South Pole by comparison between our snow data and unpublished aerosols composition data by Maenhaut, Duce and Zoller. Tundra lakes as a source of fresh water: Kipnuk.

Bredthauer, S.R., et al, U.S. Army Cold Regions Research and Engineering Laboratory, Sep. 1979, SR 79-30, 16p., ADA-075 475, 12 refs. Doerflinger, D.F.

Lake water, Tundra, Snowmelt, Water supply, Arctic

# regions.

regions.

A study of water quality in several small tundra lakes near Kipnuk, Alaska, was conducted to determine if the lakes were of sufficiently high quality during the snowmelt season to provide the village with enough water for a year-round supply. Since the village is located just 4 miles inland from the Bering Sea, primary emphasis was placed on locating water sources with low chloride concentrations. The tundra lakes were of sufficiently high quality to be pumped into a storage area during early summer to be used as a year round supply.

Dynamic thermodynamic sea ice model.

thickness, Mathematical models.

A numerical model for the simulation of sea ice circulation and thickness over a seasonal cycle is presented. This model is used to investigate the effects of ice dynamics on arctic ice thickness and air-sea heat flux characteristics by carrying out. several numerical simulations over the entire Arctic Ocean region. The essential uea in the model is to couple the dynamics to the ice thickness characteristics by allowing the ice interaction to become stronger as the ice becomes thicker and/or contains a lower areal percentage of thin ice. The dynamics, in turn, causes high oceanic heat losses in regions of ice divergence and reduced heat losses in regions of convergence. To model these effects consistently, the ice is considered to interact in a plastic manner with the plastic strength chosen to depend on the ice thickness and concentration. The thickness and concentration in turn, evolve according to continuity equations which include changes in ice mass and percent of open water due to advection, ice deformation and thermodynamic effects. several numerical simulations over the entire Arctic Ocean re-34-742

Insulating and load-supporting properties of sulfur

foam for expedient roads in cold regions.

Smith, N., et al, U.S. Army Cold Regions Research and Engineering Laboratory, Sep. 1979, CR 79-18, 21p., ADA-074 694, 6 refs.

ing strength. Freeze thaw cycles.

Temperatures of the subgrade and of sulfur foam insulation test sections in an expedient road were monitored with thermocouples to document freezing and thawing conditions. Vehicular trafficking was conducted on a limited basis to determine the load supporting capabilities of the foam. The sulfur foam, placed directly under a prefabricated surface mat, was found to be unsuitable for use as an expedient thermal insulation and traffic load supporting material, primarily because of its low tensile strength and high brittleness. The insulating value of sulfur foam produced by the batch process in the field was about one-half that of extruded polystyrene, meaning double the one-half that of extruded polystyrene, meaning double the thickness for equal protection against thaw

Climatology, Meteorological data.

Climatology, Meteorological data.

Section 1 deals with physical properties of the two soils used and the changes in soil chemical characteristics. The physical properties of the soil are those most important in controlling the rate of water movement in soils, such as saturated and unsaturated soil hydraulic conductivity, particle size distribution, bulk density, void ratio, available water and specific gravity. The chemical characteristics of the soil that are of potential importance in assessing the short and long-term effects of wastewater application on land include: free iron oxides, organic carbon, organic nitrogen, pH, conductivity, cation exchange capacity, exchangeable cations, total and extractable phosphorus, and total and extractable heavy metals. Section 2 summarizes climatic conditions at the CRREL site in Hanover, New Hampshire, and the changes that occurred during the period 1974 to 1978. Climatic parameters include temperature, precipitation, wind speed, and soil temperature at depth. 34-744

Determination of dissolved nitrogen and oxygen in

water by headspace gas chromatography. Leggett, D.C., U.S. Army Cold Regions Research and Engineering Laboratory, July 1979, SR 79-24, 5p., ADA-074 411, 25 refs. Lake water, Water chemistry.

Lake water, Water chemistry.

In this study dissolved oxygen and natrogen were determined by shaking 20 to 25 ml of water with an equal amount of helium in a 50-ml gas-tight syringe and injecting 2 ml of the equilibrated headgas into a gas chromatograph. Oxygen and nitrogen were separated on a 5-A molecular sieve column at ambient temperature and detected with a hot wire detector, using atmospheric air for calibration. Advantages of this method over previously reported methods are 1) oxygen and nitrogen are determined in a single analysis. 2) no specifically fabricated stripping apparatus is needed, and 3) analysis can be done in the field with completely portable, battery-operated equipment. The method appears to be accurate and reproducible; several lake O2 and N2 profiles were obtained using this technique. 34-745

structural steel frame is overstressed in a few areas, and the structural steel frame is overstressed in a few areas, and the lower portion of the subsurface timber truss enclosure is in bad condition. Additional performance measurements are needed during 1979 to determine the rate of secondary stress in the structural steel frame and the rate of deterioration of the truss enclosure. With this information, a decision can be made. enclosure. With this information, a decision can be made whether to move the building sideways onto a new undistorted foundation or to stabilize it in-place by encapsulating the lower 52 ft of the substructure in ice.

Utilization of sewage sludge for terrain stabilization in cold regions, Part 2.

Gaskin, D.A., et al, U.S. Army Cold Regions Research and Engineering Laboratory, Aug. 1979, SR 79-28, 36p., ADA-074 725, 10 refs. For Part 1 see 32-1368. Palazzo, A.J., Rindge, S.D., Bates, R.E., Stanley, L.E. Sludges, Sewage disposal, Soil stabilization, Vegetation.

tion.

From June 1975 to Sep. 1976, a research/demonstration study was conducted at CRREL in Hanover, New Hampshire, to investigate the use of sewage sludge, commercial fertilizer and cultivation techniques for terrain stabilization in cold regions. Twenty-seven test plots on a 16-deg west-facing slope received various combinations of: 1) surface preparation (tining, bull-dozer tracking, or compacting), 2) nutrient source (sewage sludge or fertilizer), 3) mulching agent (wood fiber mulch or peat moss), and 4) tacking agent (Terra Tack III or Curasol). The plots were seeded in either the spring or fall with a constant seed mixture. The effectiveness of the treatments was determined through vesetation yields and soil loss measurements. mined through vegetation yields and soil loss measurements.

34-747 Phenomenological description of the acoustic emission response in several polycrystalline materials.

St. Lawrence, W., Journal of testing and evaluation,
July 1979, 7(4), MP 1246, p.223-228, 11 refs.

Snow deformation, Snow cover structure, Snow acoustics, Acoustic measurement, Models.

The pattern of acoustic emission response in snow subjected to constant deformation rates is examined. The structural character of snow is discussed, and an equation that describes the pattern of the acoustic emission response is derived. Comparison between the predicted acoustic response and experimental data is made and the agreement is shown to be excellent. The acoustic emission response for 7075-76 aluminum and iron-3% silicon subjected to constant rates of deformation is also considered. The acoustic emission equation derived for snow represents the response in these materials. It is suggested that the internal fracture concept used to develop the model for snow may also apply to other densely packed polycrystalline materials.

ping, Spaceborne photography, Ice floes, Antarctica
—Oueen Maud Land.

—Queen Maud Land.

The author has identified the following significant results. A nearly complete map of the Dronning Maud Land coastline from 10W to 29E was produced. Based on this, it was determined that for the past 20 years the minimum calving rate from this part of the coastline was 60 cu km/year. The drift speeds were measured for ice floes and bergs between 9 and 20 km/day, and it was found that the number of ice floes of a given size decreases exponentially with size, so that each size class covers approximately the same area. A large melt phenomenon at blue ice fields around 70.7S and 26-29E was discovered.

Critical velocities of a floating ice plate subjected to in-plane forces and a moving load.

Kerr, A.D., U.S. Army Cold Regions Research and Engineering Laboratory, Aug. 1979, CR 79-19, 12p., ADA-075 455, 6 refs.

Floating ice, Dynamic loads, Velocity. The critical velocities of loads moving over floating ice plates have been determined by several authors. In all these analyses

- American Street Street Street

it was assumed that the in-plane force field in the ice cover is zero. However, due to constrained thermal strains, in-plane forces do occur in the field. The purpose of the present paper is to determine their effect upon the critical velocities of the moving loads. It is shown that a uniform compression force field reduces the critical velocity, whereas a tension force has the opposite effect

mate, Tundra, Meetings.

The work program of the 11th International Polar Meeting marking the 150th anniversary of the Berlin Geographical Society, consisted of studies of the Arctic and Antarctic. This volume of abstracts of papers presented at the meeting includes the following topics: glaciology, marine biology (special attention to krill), geomorphology, climatology and tundra ecosystem. Scientists from the U.S., Argentina, Germany, Austria and Canada participated.

Sea ice, Snow cover, Climate, Spaceborne photogra-

The symposium, the proceedings of which are presented in this volume, was held to review the status of the global observing system coming into being to support the First GARP Global Experiment. The papers and abstracts are assembled in six sessions. The list of topics of the various sessions represent those special kinds of space-based observations that are needed to special kinds of space-based observations that are needed to complement ground-based observations in order to meet the observational requirements for the First GARP Global Experiment. The topics of the sessions are: Temperature and humdity fields derived from sa'ellite observations; Surface characteristics of importance to weather and climate; Wind determination from geostationary satellites; Role of the earth's radiation budget in atmospheric dynamics; Data collection systems and some programmatic developments; and Application of satellite data to numerical analysis and prediction.

Characteristics of antarctic sea ice as determined by

Zwally, H.J., et al. Symposium on Meteorological Observations from Space: Their Contribution to the First GARP Global Experiment, Philadelphia, June 8-10, 1976, Proceedings, Boulder, Colo., National Center for Atmospheric Research, Sep. 1976, p.94-97.

Wilheit, T.T., Gloersen, P., Mueller, J.L.

Sea ice distribution, Polynyas, Ocean currents, Wind

Features of the antarctic sea ice, such as detailed variations in ice extent and areas of ice divergence induced by winds or ocean currents, can be discerned in microwave images. Images with resolutions of about 30 km are produced from the Electrically Scanning Microwave Radiometers (ESMR) having waveringths of 1.55 cm on Nimbus 5 and 0.81 cm on Nimbus 6. For the GARP data system tests, weekly maps of sea ice coverage are generated showing the percent of open water in each cell. More detailed studies of the dynamics and thermodynamics of the sea ice, and its interaction with the ocean and atmosphere, are in progress using 3-day average pseudo-color images and maps of ice boundaries. During the austral winters, pollynyas and areas of reduced ice concentration are observed. ice extent and areas of ice divergence induced by winds or ocean

Spectroscopy.

The scanning microwave spectrometer (SCAMS) on the Nimbus-6 satellite continuously maps the terrestrial surface and yields brightness temperatures which are a function of the distribution and character of various types of snow and ice, including microstructure and subsurface profiles in refractive index, loss (moisture, salimity) and temperature. To aid in the interpretation of this data, a model was developed to describe the propagation of incrowave intensity in a scattering medium characterized by three-dimensional random fluctuations of refractive index of salitions to present the salities to the dex in addition to non-random variations in remarkive in-perature, and loss. The model combines Maxwell's equations in the Born approximation with radiative transfer theory and has been applied to the thermal emission of snow and ice in Antarctica and Greenland

Snow cover distribution, Sea ice, Ice cover, Charts, Climate.

Snow in the northern hemisphere formed earlier in the year and Snow in the northern hemisphere formed earlier in the year and covered a substantially larger area on an annual average during 1971-73 than in the rest of the 1967-1975 interval. The differences are largest in autumn and spring. The anomaly was associated with diminished summer ice coverage in the Barents Sea and more snow in Central Asia. Preliminary examination of antarctic ice charts indicates a similar fluctuation apparently in phase with the northern hemisphere. (Auth.)

Monitoring earth surface characteristics important to weather and climate with earth satellites.

McClain, E.P., Symposium on Meteorological Observations from Space: Their Contribution to the First GARP Global Experiment, Philadelphia, June 8-10, 1976, Proceedings, Boulder, Colo., National Center for Atmospheric Research, Sep. 1976, p.129-135, 48

Sea ice distribution, Snow cover distribution, Ice

Sea ice distribution, Snow cover distribution, Ice cover thickness, Spaceborne photography.
Many of the observational requirements specified for the First GARP Global Experiment and for the GARP Climate Dynamics Subprogram are variables classified as Earth surface characteristics. Many of these characteristics are such that the required space and time resolutions of the observational data can be met only with the aid of data gathered by Earth satellites Among the variables in question are sea, ice, and land surface temperature; snow conditions; sea ice conditions; wind stress over the ocean and surface currents; and soil moisture. This paper reviews progress in satellite data applications with respect to the monitoring of these surface characteristics, with emphasis upon the use of operational environmental satellites of the USA. The satellite-documented drift of an antarctic iceberg is illustrated and briefly discussed.

Economic development, Sea ice, Icebergs, Research projects, Engineering.

This report is a review of polar ocean engineering research and technology that are considered necessary to the support of commercial and scientific operations in the Arctic and Antarctic during the 1980's. In presenting the panel's view of the critical national needs in polar ocean engineering, the report identifies and examines the technical deficiencies in today's state of the art and recommends ways of improving the situation. For the Antarctic, major attention is directed toward the technology necessary for harvesting krill and considerations involved in the exploitation of antarctic icebergs.

value problems, Analysis (mathematics). Presented in this paper is the theory of the steady in-plane deformation, obeying the Coulomb yield criterion, of plastic soils whose strain rate and stress principal directions are non-coaxial. The constitutive equations including an unknown noncoaxial angle are derived by use of the geometry of the Mohr circle and the theory of characteristic lines. A boundary value problem is solved by assigning to the non-coaxial angle a set of such values that enable us to accommodate the presupposed type of flow satisfying the given boundary conditions in a given domain. The plastic material regulated by the Coulomb yield criterion in in-plane deformation is, therefore, a singular material whose constitutive equations are not constant singular material whose constitutive equations are not constant with material but are variable with flow conditions.

Flame drilling through the Ross Ice Shelf.
Browning, J.A., Northern engineer. Spring 1978, 10(1), p.4-8, 4 refs.
Ice drills, Thermal drills, Antarctica—Ross Ice Shelf.

Described in the article are the flame drilling equipment and some of the problems associated with drilling on the Ross Ice Shelf. A flame jet, produced by the continuous combustion of fuel oil in a high pressure air flow, melted the ice to the sea in about 7 drilling hours. Major problems were hose feed arrangements and the risk of hole closure.

Biochemical activities of organic soils from subantarctic tussok grasslands on Campbell Island. 1. Oxygen uptakes and nitrogen mineralisation. Ross, D.J., et al, New Zealand journal of science, June 1979, 22(2), p. 161-171, 23 refs.
Campbell, I.B., Bridger, B.A.

Soil chemistry, Soil science, Organic soils, Campbell

Oxygen uptakes and nitrogen (N) mineralization were measured with samples of organic soils taken at 4 or 5 depths from tussock grasslands at 5 sites ranging in altitude from 45 to 400 m on subantarctic Campbell Island. An altitudinal sequence in chemical or biochemical properties was not evident, probably because of local site effects. Although these soils have been

shown to be potentially active biochemically, metabolism in the field would be severely restricted by the prevailing cool climate (Auth. mod.)

Speir, T.W.

Soil science, Organic soils, Soil chemistry, Campbell Island.

Island.

Invertase, amylase, cellulase, hemicellulase, urease, phosphatase, and sulphatase activities were high, on a soil dry weight basis, in the top horizon of organic soils from 6 sites on subantarctic Campbell Island. They generally declined with soil depth, more rapidly than did organic Contents. The enzyme activities were correlated negatively, and generally significantly, with degree of peat decomposition and mainly onosignificantly, although positively, with soil organic C and total N contents. All of the enzyme activities, with the partial exception of hemicellulase, were correlated significantly with each other and with soil oxygen uptakes. Most of the enzyme activities were appreciably higher in standing dead material of the tussock grass. Pow Interiors than in the top horizon of soil at each site; sulphatase activity, however, was always lower in standing dead material, and urease activity varied with sit. Although a direct contribution by tussock plant material to soil enzyme activities (except sulphatase) appears likely the levels of enzymes in these soils were (except for invertase) not directly related to the enzyme activities of tussock plant material (Auth.)

A volumetric constitutive equation was developed to character A volumetric constitutive equation was developed to characterize the behavior of snow subjected to large compressive volumetric deformations. By treating the material as a suspension of air voids in a matrix material of polycrystalline ice, a rate-dependent volumetric constitutive law was formulated and found to accurately predict material response to pressure loads for a wide range of load rates. Comparison of the theory with shock wave data was not considered in this paper, although the constitutive law appears to be valid for such load situations. One application to oversnow mobility of tracked vehicles was made. In this case, power requirements due to snow compaction were calculated parametrically in terms of vehicle speed, track loading, and snow density. track loading, and snow density

This report provides a program for calculating the deflection and stresses of a floating ice sheet using a pocket calculator. The program user must select appropriate values for the ice mechanical properties in order to compute reliable deflection and stresses. Engineering judgement must be used to select the allowable ice strength and when dealing with non-ideal situations.

Porosity and gas content of recent polar ice, applications to deep core analysis. [Porosité et teneur en gaz de la glace polaire récente; applications a l'étude des

carottes prélevées en profondeur<sub>1</sub>, Lebel, B., France. Centre national de la recherche scientifique. Laboratoire de glaciologie. Publica-tion. 1978, No.255, 80p., In French. Thesis, Univ. scientifique et médicale de Grenoble. Refs. p.77-80. Ice density, Gas inclusions, Ice physics, Porosity, An-tarctica—Law Dome, Antarctica—Dumont d'Urville Station.

Field studies were done at Camp Century and at a number of locations in the Antarctic to determine porosity and gas content of ice, as they vary with depth, pressure and temperature. Short-term variations only were investigated. The effect of

geographic variations on porosity and gas inclusions was also studied. Short-term gas content changes are primarily due to the different porosities of the ice layers. Gas content variations with depth can shed light on thickness of layers in the polar caps, but the area of study must be carefully chosen. Best for this purpose are the sections between 1000 and 2000 m in the Antarctic, which reveal ice changes effected by climatic change.

lation, Snow impurities, Pailout.

This monograph concerns various low-level beta-radiation sources in snow as well as a number of methods used to determine emissions. Analysis of natural and artificial beta radiation in polar snow samples requires an automatic device to determine low levels. The laboratory being half underground and the antiradiation chamber made it possible to climinate cosmic radiation. The device is described in detail, and results of studies on polar snow (annual accumulation, dating, levels of natural and fission-product radiation) are presented.

91p. Master's thesis. 26 refs. Sea ice, Ice forecasting, Wind (meteorology), Spacecraft, Ice conditions, Weddell Sea.

craft, Ice conditions, Weddell Sea.

Three forms of meteorological analysis have been used for this study: meridional sea level pressure differences, low level wind directions, and cyclonic storm positions and trajectories. The results show a statistically highly significant relationship between the east-west widths of open water and all three of the meteorological parameters stated above. Average ice/wind factors of 0.6% and 1% are obtained and compare favorably with values obtained by previous investigators. High quality satelite data and extensive satellite coverage have improved trajectory forecasts for cyclones in the Southern Ocean. Forecasts

- Level and the saw relation when he

of wind-induced ice cover variations may therefore possibly be made for Antarctic regions affected by these synoptic systems. However, there is evidence that factors such as freezing and restricted freedom of movement for ice floes can also be impor-Therefore, an ice-open water forecast scheme should not he based on wind stress alone

currents, Dielectric properties, Anisotropy.
Results of impulse radar studies of sea ice near Prudhoe Bay, Alaska, show that where there is a preferred current direction under the ice cover, the crystal structure of the ice becomes highly ordered. This includes a crystal structure with a preferred horizontal c axis that is oriented parallel with the local current. The radar studies show that this structure behaves as an anisotropic delectric. The result is that when electromagnetic energy is radiated from a dipole anienna in which the E field is oriented perpendicular to the c axis azimuth, no bottom reflection is detected. It was also found that the frequency dispersion of anisotropic sea ice varies in the horizontal plane. This is demonstrated by the center frequency of the reflected signal spectrum, which is maximum in the preferred c axis direction and minimum perpendicular to it. In addition, it was found, that the frequency dispersion is related to the average bulk brine volume of the ice but that the bulk dielectric constant of the ice, as determined from impulse travel time, shows little of the ice, as determined from impulse travel time, shows little correlation with the coefficient of anisotropy.

sics, Antarctica—Folger, Cape.
In this paper, the measured physical properties of core to be drock taken at Cape Folger, East Antarctica, are used to comor this paper, the measured physical properties of core to bedrock taken at Cape folger. East Antarctica, are used to compute a depth-reflection coefficient profile for comparison with observed radio-echo reflections. The measurements available on physical properties are density variations, bubble size and shape changes, and crystal fabric variations. In calculations to the calculated dielectric property changes corresponding to the calculated dielectric property changes corresponding to the highest observed reflection coefficients. However, bubble changes alone can also account for reasonable, though lower, reflection coefficients at the depths corresponding to observed reflection locations. The close correspondence between the depths of the bubble shape changes (which are definitely deformational features) and the depths of the density variations, and between both of these and the radio-echo layers, indicates that deformational events in the ice sheet's history are represented by the variations in physical properties and associated radio-echo records. cles. Antarctica-South Pole.

Snow composition, Patiout, Isotope analysis, Particles, Antarctica—South Pole.

Snow samples were taken from a 5-m-deep pit located near the South Pole station in Jan. 1975, and continuous deuterium, ritium and beta activity profiles have been obtained from them. The first artificial tritium, due to the 1952 by experiments, was detected during 1954. A two-year delay between explosions and fallout suggests that the tritium fallout is related to the main nuclear tests from 1952 to 1960. A stratospheric half residence time equal to 20 months is deduced from the fallout decrease occurring after the 1966 peak. For the French southern hemisphere experiments, it is about one year. A sharp tritium decrease is observed after a high 1973 peak, providing a new tritium reference level for future glaciological studies in Antarctica. The beta and tritium peaks occur respectively during the antarctic summer and the antarctic winter, showing different injection mechanisms. This winter input and the high tritium values registered at the South Pole indicate a preferential tritium transfer over the pole area. Two mechanisms stratospheric-tropospheric exchange and direct stratospheric cloud precipitation, could account for this injection. (Authmod.)

Soil water migration, Heat transfer. This paper presents a set of partial differential equations that describes the concurrent one-dimensional flow of liquid and heat in unfrozen unsaturated soils. A Galerkin finite element method based on hermite polynomials was used to solve the equations numerically. To verify both the theory and the solution method, laboratory measurements were made on a horizontal soil column. The results furnished essential transport coefficient values, as well as data records over space and time for infiltrations of cold water that produced steep, interacting temperature and moisture content gradients. Comparison of measured and predicted values showed very good agreement in both the moisture and temperature domains. Contrary to the usual assumption in soil studies, liquid convection played a large role in the heat transfer. A simple geometric mean formula represented the soil thermal conductivity quite adequately.

Comment and reply on "Late Quaternary extent of the West Antarctic ice sheet: new evidence from Ross Sea cores

Fillon, R.H., et al, Geology, Nov. 1979, 7(11), p.518-519, 17 refs.

Kellogg, T.B., Truesdale, R.S., Osterman, L.E. Ice sheets, Grounded ice, Glacial geology, Antarctica

R. Fillon disagrees with the conclusions of Kellogg and others (1979; 33-3970 or E-21853) pertaining to the late Cenozoic

history of the Ross Sea. Three principal areas of disagreement are noted, the biostratigraphic significance of disagreement are noted, the biostratigraphic significance of Globicassidulina biora, the origin of the sandy unit, and the nature of Late Phocene sedimentation. Kellogg et al-hold that the concept of grounded ice filling the Ross Sea embayment, even during the last glaciation, is fundamental in interpreting the glacial history of Antarctica.

Climatic and synoptic study of the Weddell Sea region during the austral fall months.

Komro, F.G., Madison, University of Wisconsin, 1978, 46p., Unpublished Master's thesis. 20 refs. Sea ice distribution, Ice conditions, Pack ice, Wind (meteorology), Climate.

(meteorology), Climate.

This study focuses on two main topics: the climatic conditions of the Weddell Sea during the austral fall months, and an analysis of the cyclone whose windfield indirectly trapped the General San Martin on Feb. 26, 1975. The evidence indicates that in addition to the residence time of cyclones and or the frequency of their appearance over the central Weddell Sea, other factors, such as the polar easterlies, the damming up effect along the Peninsula, and katabatic winds must significantly account for much of the observed windfield within this region.

Ice sheets, Sea ice, Glaciology, Ice shelves.

Ice sheets, Sea ice, Glaciology, Ice shelves.
This issue contains highlights of the 1979-80 U.S. Antarctic Research Program, planned field projects for 1979-80, planned major field camps, NSF funds awards for Apr. 1-June 30, 1979, monthly climate summary corrections, and special news announcements. Research highlights include geological studies of the Elisworth Mountains and an investigation of wave-particle interactions in the magnetosphere from Siple Station. Approximately 80 science projects are planned for the coming season. Brief descriptions are given of research projects. A major field camp will be installed at site D-59 on the East Antarctic Ice Sheet to recover an LC-130 airplane that crashed at the site in 1971.

Seidenbusch, W., Blumthaler, M., Kirchlechner, P.,

Ambach, W. Snow, Water flow, Drainage.

Snow, water now, Drainage.

Experiments were conducted to study the flow of water through columns of homogeneous, repacked snow. The gravity flow theory of water flow through snow was verified, although possibly there is some dependence of the relative permeability on the state of metamorphism of the snow. Also, at very large values of saturation there may be some additional flow in saturated channels.

Thermal emission of randomly inhomogeneous layered media.

Brekhovskikh V.L. et al Akademiia nauk SSSR. Izvestiya. Atmospheric and oceanic physics, Sep. 1977, 13(2), p.101-106, Translated from Its Izvestiia. Fizika atmosfery i okeana. 8 refs.

Thermal radiation, Radiometry, Glacier ice, Stratification.

cation.

Multiple reflection from inhomogeneities is used to derive features of thermal radio emission of layered structures such as antarctic glaciers. The coefficients of reflection of electromagnetic waves from a random layered medium with a small dielectric loss are calculated for both horizontal and vertical polarizations. The equations containing the function of probability distribution for the reflection coefficient are used. The angular distributions of brightness temperature are obtained for both polarizations. The computed results are compared with experimental data obtained by remote sensing from the satellites Cosmos-243 and Cosmos-384. (Auth.)

Snow crystal structure, Firn, Ice crystal structure, Snow permeability, Ice physics, Antarctica—Mizuho Station. Antarctica—Byrd Station.

Station, Antarctica—Byrd Station.

Structure and properties of antarctic snow and ice recovered by drilling at Mizuho and Byrd Stations are discussed with reference to the similarity between densification of antarctic snow and ice and the ceramic firing process. The similarity lies in that in both systems the constituent powder materials, ice and soil particles respectively, expand and bond by a common mechanism of sintering at a high homologous temperature. It is suggested that the distinction between snow and ice in terms of contents. of permeability is analog us to that between earthenware and porcelain in ceramics

ridges, Ice cover thickness.
Radar backscatter measurements were made of shorefast sea ice near Point Barrow, AK, in May 1977, with a surface-based FM-CW scatterometer that swept from 1-2 GHz and from 8.5-17.5 GHz. The 1-2 GHz measurements showed that thick first-year and multiyear ice cannot be distinguished at 10-70 deg incidence angles, but that undeformed sea ice can be discriminated from pressure ridges and lake ice. Results also indicate that frequencies between 8-18 GHz have the ability to discriminate between thick first-year, multiyear, and lake ice Cross polarization was found to be a better discriminator than like polarization. In addition, at these latter frequencies the differential scattering was found to have an approximately linearly increasing frequency response.

Antarctica—Ross Ice Shelf.

Participating nations in the IAGP reported accomplishments in 1972 and outlined plans for 1973. The glaciology working group formulated plans and recommendations which include additional glaciological work on the Antarctic Peninsula, satellite investigation of sea ice variations, use of glacial deposits to monitor world-wide pollution levels, and micro-glaciological studies in East Antarctica. Borehole site selection has already begun on the Ross Ice Shelf.

A theory of the optical properties of snow in the 2-20 microns A theory of the optical properties of snow in the 2-20 microns region of the infrared has been developed. Using this theory, it is possible to predict the absorption and scattering coefficients and the emissivity of snow, as function of the snow parameters of grain size and density, for densities between 0.17 and 0.4 g/cu. cm. The absorption and scattering coefficients are linearly related to the density and inversely related to the average grain size. The emissivity is independent of grain size and exhibits only a weak dependence upon density.

Crystal alignments in the fast ice of Arctic Alaska. Weeks, W.F., et al, U.S. Army Cold Regions Research and Engineering Laboratory, Oct. 1979, CR 79-22, 21p., ADA-077 188, 9 refs. Gow. A.J.

Ice crystal structure, Fast ice, Ice crystal growth, Sea ice. Ocean currents.

Field observations at 60 sites located in the fast or near-fast ice along a 1200-km stretch of the north coast of Alaska between Bering Strait and Barter Island have shown that 95% of the ice samples exhibit striking c-axis alignments within the horizontal plane. Such alignments were usually well developed by the time the ice was 50 cm thick and in some cases when the ice was 20 cm thick. In all cases the degree of preferred orientation increased with depth in the ice. Representative standard deviations around a mean direction in the horizontal plane are commonly less than 10 deg for samples collected near the bottom of the ice. The general patterns of the alignments support a correlation between the preferred c-axis direction and the current direction at the ice/water interface. A comparison between c-axis alignments and spot current measurements made at 42 locations shows that the most frequent current direction coincides with the mean c-axis direction. Such alignments are believed to be the result of geometric selection with v.e. most favored orientation being that in which the conflow normal to the (0001) plates of ice that compose the de dritic sea ice/sea water interface. Field observations at 60 sites located in the fast or near-fast ice

Towing ships through ice-clogged channels by warping and kedging.
Mellor, M., U.S. Army Cold Regions Research and Engineering Laboratory. Sep. 1979, CR 79-21, 21p., ADA-077 801, 6 refs.

Channels (waterways), Ice cover, Ice pressure, Ships,

Channels (waterways), the cover, the pressure, Snips, Aanchors.

The report studies the question of whether Great Lakes freighters could move effectively through ice-clogged channels with the aid of tows provided by warping or kedging systems. Ten operational concepts are outlined, and their advantages and isadvantages are noted. The crushing resistance of floating brash ice is then analyzed. The neutral, active and passive states of stress for laterally confined brash ice are considered, and the resistance to horizontal thrusting by a smooth vertical wall is calculated for cohesionless brash ice, and for ice in which there is finite cohesion between the ice fragments. The thickening of the ice cover in the vicinity of a "pusher" and the formation of pressure ridges are analyzed in order to estimate the amount of pile-up that can occur against a ship hull. The analysis then moves on to consideration of ship resistance by brash ice, taking into account crushing resistance at the bow, tangential friction at the bow, and the hull friction aft of the bow section. Comparisons are made between thrust from the ship's screws and the calculated ice resistance. The next section of the report estimates the force requirements for a warping or kedging system in terms of thrust augmentation for existing vessels. Tow cable requirements are given, and estimates are added for cable anchors and for anchorage of underwater structures. The force and power requirements for winches and windlaws are given. The practical problems involved in the made for cable anchors and for anchorage of underwater structures. The force and power requirements for winches and windlasses are given, the practical problems involved in the pickup or transfer of cables are mentioned, and the report concludes with a brief appraisal. The conclusion is that a simple warping tug system is appropriate for a full-scale experiment, a chain ferry with auxiliary barge seems attractive for an operational system, and a chain ferry plow may be an efficient way to clear ice from channels.

Bacterial aerosols from a field source during multiplesprinkler irrigation: Deer Creek Lake State I ark, Ohio.

Onto.

treatment, Waste disposal, Irrigation,

Water treatment, Waste disposal, Irrigation, Aerosols, Microbiology.

An evaluation of microbiological aerosols resulting from the spray irrigation of wastewater under known atmospheric stability conditions: was performed during July and August 1978 at the Deer Creck Lake land treatment system in Ohio. In the experiment, ponded chlorinated wastewater was aprayed onto a 6-acre test area with 96 impact sprinklers representing a multi-source field aerosol distribution system. Approximately 99.9% of the wastewater applied to the 23-hectare test area fell within the area of influence of the sprinkler (about a 20-m diam circle around the sprinkler riser) with only 0.10% of the applied wastewater aerosolized. Indigenous total aerobic bacteria in the wastewater and resultant aerosols were sampled and analyzed. Fluorescent dye studies were also performed to characterize the aerosol cloud without the effects of biological decay. During

all of the aerosol tests continuous on-site meteorological measurements were made and wastewater chemical parameters monitored.

Meteorological aspects of the drift of ice from the Meteorologica: aspects of the drift of ice from the Weddell Sea toward the mid-latitude westerlies. Schwerdtfeger, W., Journal of geophysical research. Oct. 20, 1979, 84(C10), p.6321-6328, 31 refs. Ice shelves, Sea ice, Drift, Wind (meteorology), Wed-

dell Sea.

Persistent, moderate to strong southerly surface winds, socalled barrier winds, develop along the east side of the Antarctic
Peninsula when the prevailing easterlies over the central and
southern Weddell Sea carry cold, stable air masses toward the
1200- to 2000-m-high mountain barrier. Because of the lack
of observations from the Weddell Sea itself, wind data for the
thopographically similar Ross Ice Shelf area are used to estimate
the probable lateral extent of barrier winds. Frequency and duration of different types of winds at the key station Matienzo
indicate the importance of the barrier effect for the drift of large
ice masses northward and northeastward to the relatively low
latitude of 63S. Such a guided discharge of ice into the belt of
the subpolar and mid-latitude westerlies, not to be found in
other sectors of the Antarctic, has a profound effect on the
temperature conditions over the southern South Atlantic. Evidence for each of these statements is presented. (Auth.)

34-1405

New role for icebergs.

Quinn, K.J., Marine affairs journal, Jan. 1978, No.5, p.72-95, 94 refs.

Iceberg towing, Ice (water storage), Water supply. This discussion proceeds in two parts: first, it describes the emerging geographic qualities and attributes with which other world regions could most directly apply the practice of obtaining icebergs as a source of fresh water and other benefits, using current knowledge of the situation. Second, it examines the undecided nature of international law governing the ownership and transfer of icebergs. The characteristics of the iceberg resources available are described and the desirable attributes of a compatible destination are outlined. Present studies have concluded that towing antarctic icebergs to arid regions is technically feasible and can provide large quantities of fresh water at costs significantly lower lower than capital and/or energy-intensive alternate processes such as overland conveyance or seawater desalination. Iceberg towing, Ice (water storage), Water supply. seawater desatination

Snow cover distribution. Pack ice. Ice conditions, Indexes (ratios), Heat balance, Charts.

dexes (ratios), Heat balance, Charts.

Data on snow pack ice distribution in the Northern and Southern Hemispheres are obtained by analyzing NOAA charts. A total of 70 geographic segments are assessed. Mr asirement is done by counting grid points along latitudinal lines. The grid density for the Southern Hemisphere is 2 deg of longitude per 2 deg of latitude equatorwards of latitude 70 deg, and 4 deg of longitude per 2 deg of atitude polewards of latitude 70 deg. A separate set of snow and ice cover indices is obtained by planimetering NOAA charts.

Total gas content and surface elevation of polar ice sheets.

Raynaud, D., et al, *Nature*, Sep. 27, 1979, 281(5729), p.289-291, 10 refs.

Lebel, B. Ice sheets, Ice cores.

Interpretation of stable isotope profiles from polar ice cores in terms of past climate requires a knowledge of the elevation at which the ice found at any depth was formed. Measurement of the total gas content of polar ice, V, can give such information

if the volume of the pores in ice is known for the time they close off from the atmosphere at the ice formation site. Results are presented here that enable description of the variations in the total gas content of ice that has been formed in present-day conditions in Antarctica and Greenland for a wide range of temperature (-12 to -53C) and elevation (400 to 3,200 m). Using these results, the gas content method can now be applied with much greater confidence than before to indicate past elevation.

Natural variations in the concentration of stable hydrogen and oxygen isotopes (deuterium and oxygen 18) and artificial tritium are considered in determining the origin and the renewal and transit times of water in given flow systems. Much of the necessary data is "filled" in the ice at the poles and in glaciers Polar ice samples, for example, provide information on deuterium and oxygen 18 variations with mean temperature and seasonal changes in the considered precipitation area, and also on titium distribution in rain and snowfall during the last wenty years. Data yielded by core samples of ice from both polar regions and the Mont Blane glaciers in the French Alps is discussed. (Auth.)

Electron microscopy, Frozen ground physics, Soil structure. Clay soils.

Transmission and scanning electron micrographs of Umiat ben-torite revealed thin, mica-like grains with irregular shapes. Most of the bentonite showed electron diffraction ring patterns. Most of the bentonite showed electron diffraction ring patterns, but some showed hexagonal net patterns as well as ring patterns. The lengths of the unit cells were calculated to be 5.18 A along the a-axis and 8.97 A along the b-axis. Semiquantitative analyses were made using an energy dispersive spectrometer. Common elements such as Si, Ti, Al, Fe, Mg, Na and K were determined. The molecular ratio of 8i02 Al2O3 was calculated to be 492 100 for the bulk sample, indicating that Unitable thought of the seminary of the microstructure of forcer U mat bentonite was observed at a speciment temperature of -100C using a scanning electron microscope equipped with a cold stage. Frozen bentonite and segregated ice patterns formed from wet bentonite were examined using an X-ray map and 8i X-ray line scan. Sublimation processes of ice in the frozen bentonite were observed at speciment emperatures of -60 and -80C. After sublimation of the ice, the bentonite displayed a honeycomb structure. It was concluded that the freezingsublimation cycle in frozen soil increases the permeability of water vapor due to the three-dimensional structure of the coagulated clay formed by freezing

A field study was conducted to 1) more accurately define the A field study was conducted to 1) more accurately define the degree of protection offered by simple snow fortification and 2) evaluate the effort required by infantry troops to build such fortifications when only basic tools are available. A seven-man

infantry squad, equipped with standard issue snow shovels and an arctic sled (Akhio), constructed several simple snow structures. Construction was made more difficult by the imposition of a camouflage discipline requirement. When completed, three positions were subjected to MIOA1 rifle fire while the infantry squad executed a simulated tactical assault. A fourth and much larger position was tested with simulated covering fire from a M2HB 30-caliber machine gun. None of the 5-56-mm bullets fired by the squad from ranges of 200 m to as close as 10 m managed to penetrate the 1.8-m-thick snow embankments. The 12-7-mm-diameter bullets fired from the M2HB at range of 250 m were all stopped by 3.0 m of packed snow. The camouflage considerations and the shallow snow conditions increased the construction time for the three small emplacements by almost a factor of four, and for the larger emplacement by almost a factor of four, and for the larger emplacement by almost a factor of the squad still handled a volume of packed snow that was equal to 3.7 times the volume of unfrozen soil that could be handled with the same amount of effort, according to field manual estimates. Under forzen soil conditions the advantages of using snow would be significantly greater. significantly greater

density measurement by X-ray topography, tagaki, K. U.S. Army Cold Regions Research and Engineering Laboratory, Nov. 1979, CR 79-25, 12p., ADA-078-775, 23 (cfs. long-thoughts).

Ice electrical properties, Electric charge, Disloca-tions (materials), X ray analysis, Ice crystal struc-

The motion of dislocations in single cristal accumder an electric field was observed by using X-ray topographic methods. Electric charge density on these dislocations was deduced from the amplitude and length of the dislocation segment under the known AC electrical field. In linear charge density, considerable variation is possible, depending on the effective field acting on the dislocation line-

34-1609

Some Bessel function identities arising in ice mechan-

Takagi, S. I. S. Army. Cold Regions Research and Engineering Luboratory, Nov. 1979, CR 79-27, 13p., ADA-078 709, 10 refs. Ice mechanics, Analysis (mathematics).

Ice mechanics, Analysis (mathematics).

Some Bessel limetion identities found by solving problems of the deflection of a foating ice plate by two different methods are rigorously proved. The master formulas from which all the identities are derived are in a Fourier reciprocal relationship, connecting a Hankel function to in exponential function. Many new formulas can be derived from the master formulas. The analytical method presented here now opens the way to study a furtherto impossible type of problem-the deflection of floating clastic plates of various shapes and boundary conditions.

ary value problems, Snow physics.

ary value problems, Snow physics.

The grain boundaries in snow are generally unstable when the pore space is filled with liquid water (i.e., liquid-saturated snow). Thus, when unstressed snow is saturated with the melt, the ice particles in snow are cohesionless spheres. This leads to very low strengths and to rapid grain growth due to heat flow among particles of different sizes. The grain boundaries in highly unsaturated snow (up to about 7% liquid by volume) with small applied loads are stable, and the grains must be arranged in clusters to achieve local force equilibrium. Two grains bond together with geometrical constraints on the radii of the phase boundaries. Three grains join at a liquid vein whose size is dermined by grain size and cepillary pressure (i.e., liquid "entroion"). Slow grain growth occurs by sublimation, vapor diffusion, and condensation, and intergrain strength is relatively

high. Once grain clusters are formed, equilibrium imposes constraints on the curvature of the phase boundaries which limit change in the capillary pressure

Lake Champlain ice formation and ice free dates and predictions from meteorological indicators.

Bates, R.E., et al, U.S. Army Cold Regions Research and Engineering Laboratory, Nov. 1979, CR 79-26.

21p., ADA-079 640, 11 refs Brown, M.-L. Lake ice, Ice formation, Ice breakup, Meteorological data, Periodic variations.

data, Periodic variations.

A 19-yr record of the annual closing and opening dates of operation of the Lake Champlain ferry at Grand Isle, Vermont, which are controlled by the lake's ice cover, was made available to CRREL. These navigation records accurately approximated the freeze-over and breakup dates for the terry crossing area between Gordon Landing, Vermont, and Cumberland Head, New York. When compared statistically with water temperature and climatological data for the same years at nearby Lake Champlain locations, the dates allowed accurate predictions of ice formation. From nearby air temperature records, cumulative freezing degree-day (C) curves were plotted for each year of record, and ice formation dates and standard deviations were predicted with considerable accuracy. Several methods of preof record, and tee formation dates and standard deviations were predicted with considerable accuracy. Several methods of predicting ice formation on Lake Champlain were attempted. The most accurate approach used a combination of water temperatures and freezing degree-days. The influence of wind speed on ice cover formation and prediction are also discussed in the

X- or gamma-rays from supernovae in glacial ice. Rood, R.T., et al, *Nature*, Dec. 13, 1979, 282(5740), p.701-702, 19 refs.

Sarazin, C.L., Zeller, E.J., Parker, B.C. Glacier ice, Ice cores, Radiation.

Glacier ice, Ice cores, Radiation.
In an analysis of NO3 in an antarctic ice core we have found four spikes of high concentration, three of which occur at depths which correspond roughly to the dates of known galactic supernovae (SN). The production of the observed NO3 peaks by the hard X rays generated by a SN outburst (particularly Type I) does not seem inconceivable at least from the point of view of energy requiren ents and current SN models. We predict that the bright SN of 1006 will be observed about 15 m beyond the end of the current core. If this is true, our identification of these spikes with SN will have important consequences for the theory of SN, atmospheric chemistry and transport, and even the dating of ice cores. (Auth.)

Ice shelves, Ice melting, Ice cover thickness, Ice tem-perature, Antarctica—Ross Ice Shelf.

Ice shelves, Ice melting, Ice cover thickness, Ice temperature, Antarctica—Ross Ice Shelf.

The ice sheet in West Antarctica is grounded on a sub-sea level basin in the antarctic continental shelf. At the seaward margins, where ice thicknesses are reduced sufficiently to attain neutral buoyancy. Ioating ice shelves form. The two largest are the Ross and Ronne ice shelves. Because the depth of the continental shelf increases towards the center of the West Antarctic ice sheet, ice discharge could accelerate irreversibly until the grounded portion of the ice sheet had completely disappeared. The resistance to ice discharge provided by the ice shelves is the major factor preventing such a collapse. Geological evidence indicates that the extent of grounded ice in the West Antarctic has fluctuated widely during the Pleistocene, and complete removal of the ice sheet may have occurred during the Sangamon interglacial following a climatic warming, which was probably associated with a retreat of the ice-shelf seaward margins. One of the most active ice streams draining West Antarctica flows into the southeast corner of the Ross Ice Shelf. Surface observations in this area indicate that, either the ces helf is thickening, or that there is appreciable melting from beneath ice shelf that is >500 km from the open sea. Such melting would strongly influence temperatures within the ice shelf, and here a temperature-depth profile from the ice shelf is used to estimate the basal regime. It is concluded that, for much of the southeast corner, basal freezing/melting rates have been near zero for the past few hundred years. This implies that, within this region, the ice shelf is thickening at approx 0.3 m/yr. (Auth.)

A new design of tiltmeter has been used to measure the tidal A new design of tillimeter has been used to measure the tidal bending of the Ronne Ice Shelf, Antarctica—By this means the point at which the ice sheet leaves the land and starts floating on the sea has been defined to within 600m. Monitoring this position in future should give an indication of the state of balance of the West Antarctic ice sheet, often considered to be unstable even if not actually disintegrating. The hydrostatic level meter is light and simple and can operate unattended while recording continuously for periods of several weeks. Observations at eight different sites on Rutford Ice Stream gave tidal records on ice more than 1.700 m thick and at points up to 600 km from the nearest open sea—(Auth.)

Ice sheets, Mass balance, Glacier mass balance, Antarctica—Mirnyy Station.

tarctica—Mirnyy Station.

Thickness studies were done in 1962 and 1965, and long-term accumulation records were kept along a 100-km profile near Mirnyy. In spite of rather large measurement errors, tendencies in ice sheet thickness are apparent and can be compared with observations done at other continental stations. A positive mass balance occurs up to the 5-km point (probably because the ice is held in crags). After that, the ice surface gradually drops off. Global climate accounts for this phenomenon, while local factors resulting from flow mechanics account for maximum drop of 2m yr in the Helen Glacier area. South of the Helen Glacier basin, the surface appears to be almost in equilibrium.

Results of temperature measurements in Vostok boreholes. ¡Rezul'taty'termometrii v skwazhinakh na stant-

Dmitriev, D.N. Temperature measurement, Thermal drills, Ice temperature, Antarctica—Vostok Station.

Measurements down to 900 m were done to determine ice cover

temperature and also to assess the effect of thermal drills on ice temperature and also to assess the effect of thermal drills on ice temperature. The sharpest decline in temperature occurs between 20 and 60 m in depth. Borehole temperature recovers within 150-200 days after drilling. Accuracy and reliability of te temperature determinations depend on the state of the hole, its integrity and its stability. Readings done both at the time of drilling and 327 days later are in good agreement with theoretical data; at a low temperature gradient natural air convection introduces very little distortion into temperatures in deep horeholes.

Ice sheets, Thermal drills, Flow measurement, Gla-

rce sneets, Thermal drills, Flow measurement, Glacier flow, Antarctica—Vostok Station.
Beginning in 1973, study of the rce sheet movement was carried out in a 903-4-m borenole near Vostok Station. No changes in angle of inclination, measured every 8-10 months, were noted. The drilling method an electric thermal drill on a cable produced a virtually vertical hole. These findings support previous conclusions that the ice cover around Vostok is practically stationary.

Ice sheets, Ice cover thickness, Glacier thickness, Antarctica-Enderby Land.

tarctica—Enderby Land.

The present work is an attempt to establish relationships among the gravimetric charts of Enderby Land and the South Fole area and, by analyzing the gravity anomalies, to outline subglacial will also make it possible to chart the subglacial topography north and south from the Yamato Mountains and to study the Gamburtsee Subglacial Mountains. Subglacial relief data from gravimetry readings are set out in charts. Comparing these findings with echo sounding data gathered by British-American researchers shows that the Gamburtsee Subglacial Mountains are better described as highlands, which cover the central part are better described as highlands, which cover the central part of East Antarctica between Komsomolskaya and the Pole of Inaccessibility. They extend about 1000 km and have no di-rect connection with the Vernadskii Mountains.

Temperature regime of the antarctic fast ice. (Temperaturnyi rezhim antarkticheskogo pripaiaj,

Snow measurements on the antarctic shelf ice. [O snegomernykh nabliudeniiakh na antarkticheskom

Kozlovskii, A.M., Sovetskaia antarkticheskaia ek-ROZIONSKII, A.M., Sovetskaia antarkticheskaia ex-speditsiia. Informatsionnyi biulleten', 1979, No.99, p.74-77, In Russian. 8 refs. Sea ice, Sea water, Fast ice, Floating ice, Snow ac-cumulation, Snow depth, Seepage, Antarctica.

Since sea water infiltration of sea ice is different in Antarctic from that in the Arctic, traditional measures of snow accumulation on shelf ice have led to serious underestimation of snow accumulation in southern high latitudes. The depth of the snow-water layer in the Bay of Cosmonauts and near Mirnyy is discussed and charted and a new method for more accurately assessing the contribution of snow accumulation to shelf ice depth suggested.

sation, tee dating Crimate.

Simple gaceiological conditions at Dorne C in east Antarctica have made possible a more detailed and accurate interpretation of an ice core to 950 m depth spanning some 32,000 yr than that obtained from earlier ice cores. Dated events in comparable marine core has enabled the reduction of accumulation rate during the last ice age to be estimated. Climatic events re-corded in the rec core indicate that the warmest Holocene period in the Southern Hemisphere occurred at an earlier date than in the Northern Hemisphere. (Auth.)

Roads, Cold weather tests, Pavements, Bearing strength, Flexural strength.

Nondestructive repetitive plate bearing (RPB) tests were conducted on various test sections in state highways in Maine during April 13-15, 1976. The RPB test consists of making resilient surface deflection measurements during repetitive loadings at various radii from the load plate. The pavement system stiffness was calculated, and the resilient modulus values for the various pavement layers were determined with the Chevron computer program for a layered elastic system. A thawed analysis using nondimensional deflection curves for the various sections provided a guide to the susceptibility of the pavement systems to surface failure and pothole development. Some comparisons between stabilized and nonstabilized aggregate and soil were made with calculated stiffness values. The moduli of the various materials were also compared. The residual surface deflections during testing for several pavement systems indicated a linear logarithmic relationship with number of load applications. A relationship between the modulus of the asphalt cement concrete pavement and pavement temperature was developed for the limited temperature range during the testing.

Water table, Boundary value problems, Analysis (mathematics).

(mathematics).

The traditional viewpoint in hydrology and soil physics purports that water tables appearing in porous media described by Darcy's law and the extended Darcy's law are not singular surfaces. Several particular solutions in which singularities occur are presented as counter-examples to the traditional viewpoint and as evidence supporting the new theory that water tables are generally singular surfaces.

Bentley, C.R.

Ice sheets, Wave propagation, Ice density, Analysis (mathematics), Antarctica—Marie Byrd Land.

Surface-wave dispersion for the ice sheet of Marie Byrd Land, in which velocity and density increase continuously with depth and gradients near the surface are steep, has been computed by solving the equations of motion directly by finite differences. No simplifying assumptions or approximations about parameter variations with depth have been made. Computer results agree well with observed data without the introduction of any anisotropy, as was needed in a previous analysis (Acharya, 1972). Tests of the assumptions made in the previous analysis show that (a) the approximation Poisson's ratio = 1/4 introduces no significant error, even though Poisson's ratio actually varies from 1/4 to 1/3 in the upper part of the ice sheet, and (b) the assumption of a constant density, required if one is to separate compressional and shear-wave displacement potentials, is unsatisfactory. (Auth.)

analysis.

Antaicite and Afetic research studies of the past year are re-sriewed. Preliminary findings include the following. A rich and varied interobal flora has been found in rocks of the dry salleys. Major outlet glaciers from the East Antarctic ice sheet, such as the Byrd and Dawin, were found to be 1,000 m thicker near their mouths. Eighteen different amino acids, sev-eral of them unknown from modern terrestrial sources, were identified in well-preserved and uncontaminated antarctic caridentified in well-preserved and uncontaminated antarctic carbonaceous meteorites. Gee-themical investigations of the antarctic (see sheets have shown that fluctuations in the concentrations of infrate and ammonium ions, from ice and show layers of known dates, can be correlated with observed solar activity. In addition to the above studies, a field party of some 40 scientists from 7 counties worked in the Elbworth Mountains, and New Zealand scientists drilled a deep core hole in western McMurdo Sound, using annual sea ice as a drilling platform West Germany is conducting its first land-based antarctic expedition in nearly 40 yr.

Sea ice, Ice cover strength, Hydrodynamics, Glacial hydrology, Sea level, Climatic changes, Research pro-

This column includes papers devoted to the study and investigation of different aspects of actic and antarctic climatology. The first four papers deal with glacial water reserve and discharge in the Arctic Arctic cooling, large-scale sea level oscillations in the Northern Hemisphere and high relative humidity in the Arctic. Two papers are devoted to atmospheric studies in the polar regions. They cover such topics as eyelic oscillations, conjunction of certain centers of atmospheric action, characteristics of total radiation, change in wind speed and direction during geomagnetic disturbances and the relation of tomospheric troughs and plasmapause in the alternoon section. There are three papers on studies relating to the phase composition of ice, forecasting is flexical strength, and size determina-This volume includes papers devoted to the study and investigation of ice, forecasting its flexural strength, and size determina-tion of ice floes. Besides, there is a paper on the distribution of microscopic algae in Davis Sea fast ice. (Auth. mod.)

Water resources of glaciers and glacial discharge in the Arctic

Govorusha, L.S., et al, Problems of the Arctic and the Antarctic, collection of articles, 1979, Vol. 45, p.1-12, TT 75-52083, For Russian original see 30-3. 33 refs. Ivanov, V.V., Chirhov, O.P. Glacial hydrology, Glacier ablation, Runoff, Glacier

mass balance, Seasonal ablation, Seasonal variations. 14-1886

Cooling of the Arctic.

The TELGA drilling rig has been improved to allow a much deeper core to be made. Drilling operations near Vostok have yielded high-quality cores down to 800 or 900 m. Field trials combined with laboratory work have developed a system based on a thermal drill and a well-insulated heating element, using warm air to keep the borehole clear of water.

The basic principles of modelling past climates using data on the hydrologic cycle are set forth. Data on the vertical structure of glacier accumulation are a possible source of hydrologic information. This study investigates the feasibility of modelling planetary circulation on the basis of past climate periods in the southern hemisphere.

Analytica chimica acta, 1979, Vol.110, MP 1270, p.313-319, 18 refs. Water chemistry, Gases, Vapor transfer, Pollution,

Laboratories.

Laboratories.

The passage of mercury vapor from ambient air through the walls of conventional polyethylene (CPE), linear polyethylene (LPE), and Teflon (FEP) containers can seriously contaminate solutions of distilled and natural water stored in these containers. The rate of mercury contamination is dramatically increased when the sample solution contains oxidizing agents such as nitric acid or potassium permanganate, which are commonly used as preservatives to prevent loss of mercury (II) ion. The rate of contamination also depends on container material and decreases in the order CPE> LPE> FEP> glass. Freezing the samples in plastic containers is an effective way to prevent mercury contamination. When freezing is not practical, storage in glass containers minimizes sample contamination from ambient mercury vapor.

New data on antareth reconflace elevation are now available from many constant density balloons, floating at altitude of about 12.5 km, which traversed the Antareth during its 1975. To summer. They were part of 411 balloons launched in the southern hemisphere during the Tropical Wind Energy conversion and Reference Level Experiment (LWFRLE). Each balloon carries three sensors radio altimeter, pressure sensor and ambient temperature sensor. The data are received by the NIMBUS-6 satellite, whenever the balloon is within line of right. The near Polar orbit of NIMBUS-6, and the continuous day at the Pole combined to allow continuous coverage of IWLRLE balloons, south of 668, during Dec. 1975 and Jan 1976.

Lake water, Turbidity, Suspended sediments, Light transmission, Aerial surveys, Spectroscopy.

A water sampling program was accomplished at Lake Powell, Utah, during June 1975 for correlation to multispectral data obtained with a 500-channel airborne spectroradiometericld measurements were taken of percentage of light transmitance, surface temperature, pH and Secchi disk depth. Percentage of light transmittance was also measured in the labora-

tory for the water samples. Analyses of electron micrographs and suspended sediment concentration data for four water samples located at Hite Bridge, Mile 168, Mile 150 and Bulltrog Bay indicated differences in the composition and concentration of the particulate matter. Airborne spectroradiometer multispec-tral data were analyzed for the four sampling locations. The results showed that (a) as the percentage of light transmittance of the water samples decreased, the reflected radiance in-creased, and (b) as the suspended sediment concentration (mg.1) increased, the reflected radiance increased in the 1-80 mg.1 range. In conclusion, valuable qualitative information was obtained on surface turbidity for the Lake Powell water spectra. Also, the reflected radiance measured at a wavelength of 0.88 micron was directly correlated to the suspended sedi-ment concentration. ment concentration

Radio echo sounding of the Antarctic ice sheet, 1978-79; preliminary report.

Drewry, D.J., et al, Cambridge, Scott Polar Research Institute, Mar. 1979, 21p. + Append., 12 refs.

Meldrum, DT Ice cover thickness, Radio echo soundings, Subglacial observations, Rheology, Ice sheets, Glacier surfaces, Glacier surveys.

Progress achieved during the 6th sea on of an airborne radio cho sounding program of 6th the Scott Polar Research Institute in cooperation with National Science Foundation Division of Polar Programs of Flexicomagnetics Institute of the Technical University 2 mmark is reported. Broad aims of the program are to e and complete a 100 km grid network over Antarctica for sody in sorface form, thickness, network over Antarctica on soody in outlace form, thickness, internal structure, rheology, thermodynamics, electrical properties, basal conditions and processes (including sub-ice water bodies, melting and free ring beneath ice shelves), and sub-ice geology. With completion of the 1978-79 season, the radio echo sounding coverage of Antarctica is estimated to be 50% under the NSE-SPRI-IL D program, 14% by other groups, and 50% still awaiting coverage. Equipment used and operations conducted by the NSE-SPRI-IUD program in 1978-79 are described and scientific results are outlined.

Water temperature, Ice water interface, Air water interactions, Heat transfer.

The purpose of the study was to develop a model by which average ocean temperatures at present could be compared with those at the height of the last glacation (c. 1800 yrs ago). Such an integral was drawn up and the results are shown in a chart and a table. It seems that during the glaciated period mean temperature of Pacific and Atlantic Ocean water was higher than at present, while the Indian Ocean was cooler. The overall ocean temperature was higher.

tarctica—East Antarctica.

During the 1977-1978 season the French drilled a core at Dome C to shed light on the climatic history of Antarctica as part of the international glaciological program. The techniques and equipment used are discussed and shown in figures and photographs. Intital results are presented by considering the various indicators—gas inclusions, crystal structure, impurities and isotopes in the ice—of climatic changes.

Inventory of snow cover and sea ice data.

Inventory of show cover and sea ice data.

— NIZUNO Fraceau.

A summary report of the traverse glaciology project accomplished by the Japanese Antarctic Research Expedition in 1969-1975 was published in 1978 under the title of "Glaciological Studies in Mizuho Plateau, East Antarctica, 1969-1975" as a special issue of Memoirs of National Institute of Polar Research, No.7. (See 32-2701 or F-19819). This paper outlines that summary report

Growth rates of crystal grains in snow at Mizuho Station, Antarctica.

Narita, H., et al. Antarctic record, Oct. 1979, No.67, p.11-17, 16 refs.

Maeno, N.

Snow crystal growth, Snow accur Climatology, Antarctica—Mizuho Plateau.

Measurements of the mean cross-sectional area of crystal grains in snow were made with core samples drilled at Mizuho Station, Antarctica. It was found that the cross-sectional area of crystal Antarctica. It was found that the cross-sectional area of crystal grains in snow increased with increasing depth to a depth of about 50 m. The relationship between the cross-sectional area of crystal grains and the time elapsed was essentially linear, but the growth rate of crystal grains was larger in snow at depths below 35 m. The increase in the growth rate can be attributed to the stress-enhancement or the smaller rate of snow accumulation. From the growth rate of crystal grains in snow above 35 m, the net accumulation rate at Mizuho Station was estimated to be roughly 70 kg/sq m/a. (Auth.)

34-2148

Compactive viscosity of snow and its climatic implica-

Compactive viscosity of snow and its climatic implica-tions at Mizuho Station, Antarctica. Maeno, N., et al. Antarctic record, Oct. 1979, No.67, p.18-31, Refs. p.30-31. Narita, H.

Snow accumulation, Snow compaction, Climatology, Viscosity, Snow density, Snow physics, Antarctica—Mizuho Plateau, Antarctica—Byrd Station, Antarctica—Little America V.

tica—Little America V.

The compactive viscosity coefficient of snow was obtained from a density profile at Mizuho Station. The value of the compactive viscosity coefficient was by two orders of magnitude larger than that of ordinary seasonal snow. The large value was atributed to strong bonds between constituent are particles within antarctic snow which had been aged for prolonged periods. A sharp peak of the compactive viscosity coefficient was found in a limited range of the depth around 35 m that is in a range of the density around 750 kg/cu m. In the depth range from 30 m to 40 m the layer-to-layer densities varied largely and the mean density deviated markedly from a smoothed general trend. These results suggest that a colder climate occurred repeatedly and lasted approximately 300 years before the present in the vicinity of Mizuho Station. (Auth.)

Long-term variations in precipitation and surface temperature near Mizuho Station were studied by means of stratigraphic analyses of 150-m boring core. In this paper, some problems on snow stratigraphy concerning the analyses are discussed

A. S. S. Marker

First, problems on the unit of stratification are discussed in relation to visible stratigraphic elements and deposition-erosion processes. Second, phenomena of a missing layer corresponding to the hiatus in the layer formation are discussed in relation ing to the hatts in the layer formation are discussed in relation to regional characteristics and frequency of those occurrences. Precise estimation of mean annual accumulation in a certain period may be impossible without a quantitative rating of hiatus duration, and establishment of an effective method of rating should be the most important subject for the stratigraphic study. should be the most important subject to the strangraphic study. Delta-18-oxygen vertical profiles in snow layer are investigated, using the data obtained from a high-accumulation area in terms of reconsideration of the classical interpretation. As a result, it is found that a part of delta-18-oxygen oscillation was due to the variation by isotopic discrimination under snow metamorphism. (Auth.)

Sublimation and condensation at the ice sheet surface of Mizuho Station, Antarctica,

Fujii, Y., Antarctic record, Oct. 1979, No.67, p.51-63,

Ice sheets, Ice air interface, Sublimation, Ice sublimation, Condensation, Ice surface, Glacier mass balance, Antarctica-Mizuho Plateau.

Sublimation and condensation were estimated by three different methods, that is, atmometer, bulk formula and stake methods, at Mizuho Station from Feb. 1977 to Jan. 1978. The comparison of the three different methods of obtaining the sublimation rate in the summer of 1977-1978 showed a satisfactory agreerate in the summer of 1977-1978 showed a satisfactory agree-ment, especially in the weekly values. Condensation prevails from the middle of April to the middle of September and subli-mation in the remaining seven months. The daily amount of sublimation showed its maximum, 92 mg/sq cm, on December 22 when solar radiation was at a maximum. The annual amounts of sublimation and condensation are estimated to be 4.92 g/sq cm and 0.19 g/sq cm, respectively. The present study implies that sublimation plays an important role in the heat and mass exchanges at the surface and in the metamor-phism of surface texture. (Auth.)

Numerical simulation of katabatic wind profile at Syowa Station, Antarctica.

Adachi, T., Antarctic record, Oct. 1979, No.67, p.64-74. 14 refs.

Wind (meteorology), Glacial meteorology, Antarctica -Shows Station.

The vertical profiles of the strong katabatic winds at Sys Station, Antarctica, are studied. A numerical solution of the equations of the Ekman layer above the antarctic coastal slope is obtained. It is shown that the results of the numerical simulation of the strong katabatic wind profile agree well with the observed strong katabatic wind profiles at Showa Station. (Auth. mod.)

34-2152

Some characteristics of turbulence in katabatic winds over Mizuho Plateau, East Antarctica. Kobayashi, S., et al, Antarctic record, Oct. 1979, No.67, p.75-85, 20 refs. Ishida, T.

Wind (meteorology), Snow surface, Surface roughness, Turbulence, Antarctica-Mizuho Plateau.

ness, Turbulence, Antarctica—Mizuho Plateau. Wind turbulence was observed, using sonic anemometers, on a snow surface at Mizuho Station and on a bare ice field near the Yamato Mountains in the Mizuho Plateau in 1973 by the party of the 14th Japanese Antarctic Research Expedition. Observations revealed, as to katabatic winds blowing above the two places, that the one above the latter is characterized by the presence of a hydraulic jump generated by nunataks there, resulting in a stronger turbulence than the one above the former which is stationary. Hence, a comparison is made in this paper between characteristics of turbulence and a hydraulic jump in a katabatic wind. (Auth.)

Preliminary study on the structure of the atmospheric surface layer in Mizuho Plateau, East Antarctica. Sasaki, H., Antarctic record, Oct. 1979, No.67, p.86-100, 11 refs.

Glacial meteorology, Temperature gradients, Wind

Glacial meteorology, Lemperature gradients, Wind (meteorology), Antarctica—Mizuho Plateau.

A preliminary study on the structure of the atmospheric surface layer in Mizuho Plateau was made, based on the profiles and fluctuations of wind and air temperature observed at Mizuho Station during the period June-Dec. 1972. The results are summarized. High frequency of slightly stable conditions and low frequency of unstable conditions were a characteristic feature. Mean value of roughness length was 0.24 cm, larger by one order than the values at Showa Station and the South Pole. one order than the values at Showa Station and the South Pole.
The distributions of the power spectra of wind and temperature
fluctuations and those of the cospectra of heat flux were similar
to the results reported by many investigators. Temperature oscillations, which seemed to be caused by internal wave motions,
were observed in winter. (Auth.)

Oxygen isotopic composition of fallen snow in An-

tarctica.

Kato, K., Antarctic record, Oct. 1979, No.67, p.124-135, 14 refs. In Japanese with English summary.

Oxygen isotopes, Isotope analysis, Snow composition. Precipitation (meteorology). Antarctica-

The relationship between the oxygen isotopic composition of fallen snow at Showa Station and the transportation process of

water vapor to the antarctic ice sheet has been investigated. It is found that the oxygen isotopic composition of fallen snow is largely controlled by the supply of oxygen-18-rich water vapor resulting from the approach of a circumpolar cyclone, and is closely related to the distance between the open sea and the sampling station. Taking into consideration the transportation process of water vapor to the antarctic ice sheet, the correlation between the temperature of formation and the oxygen isotopic composition of fallen snow provides information about the formation process of snow. The correlation between the monthly means of the oxygen isotopic composition of fallen snow and the surface air temperature also provides information about the formation process of snow. (Auth.)

Oxygen isotopic composition of drifting snow in

Mizuho Plateau, Antarctica. Kato, K., et al, Antarctic record, Oct. 1979, No.67, p.136-151, 19 refs. In Japanese with English sum-

Watanabe, O., Satow, K.

Oxygen isotopes, Isotope analysis, Snow composi-tion, Climatic factors, Wind factors, Antarctica—

Mizuho Plateau.

Oxygen isotopic composition of drifting snow sar. pled at the various stations along the traverse routes in Mizuho Plateau was determined in order to investigate transportation of water vapor to antarctic ice sheet resulting from the approach of a circumpolar cyclone. The oxygen isotopic composition of drifting snow in every season at the stations below 1800 m in altitude is largely controlled by the supply of oxygen-18-rich water vapor resulting from the approach of a circumpolar cyclone, but it is not so at the stations above 2000 m. A large anomaly is found in the variation with altitude of oxygen isotopic composition of drifting snow at the stations at altitudes between 3100 and 3200 m in (austral) spring. The area where the anomaly is found is the boundary between the spheres of influence of circumpolar cyclones and antarctic anticyclones, and it changes its position seasonally. In winter, Mizuho Station (2230 m in altitude) is considered to be hardly influenced by circumpolar cyclones. (Auth.)

34-2156

Oxygen isotopic composition of snow formed under an antarctic anticyclone.

Kato, K., et al. Antarctic record. Oct. 1979, No.67. p.152-163, In Japanese with English summary. refs

Higuchi, K

Oxygen isotopes, Isotope analysis, Snow composition, Precipitation (meteorology), Climatic factors, Wind factors, Antarctica—Mizuho Plateau. In order to investigate the formation process of snow under an

antarctic anticyclone and the transportation process of water vapor into the anticyclone, the oxygen isotopic composition of fallen snow at Showa Station and drifting snow and firm in Mizuho Plateau was determined. Fallen snow at Showa Station is formed by the isobaric cooling process from a cloud layer under the upper inversion. Water vapor is transported to the antarctic anticyclone and subsides in it. Snow is formed by the isobaric cooling process under the subsidence inversion. The surface air temperature is much lower than the temperature of formation of snow. Therefore, on ice sheet, water vapor moves from fallen snow to surface snow. The systematic decrease of oxygen isotopic composition of snow with depth is formed in the snow cover with well-developed depth-hoar of upward crystal growth under the influence of an antarctic anticyclone, antarctic anticyclone and the transportation process of water tal growth under the influence of an antarctic anticyclone, whereas the systematic increase results from depth-hoar with downward crystal growth under the influence of a circumpolar cyclone. Axial flow wind air-turbine NU-102 with electric eddy-current brake.

Awano, S., et al, Tokyo. National Institute of Polar Research. Memoirs. Series F, Logistics, Oct. 1979, No.3, 57p., 2 refs.

Murayama, M., Takeuchi, S. Electric power, Wind power generation, Antarctica-

Shows Station.

Shows Station.

A new axial-flow wind air-turbine NU-102, having an external diameter of 1.2 in, was developed in 1977 by the authors for narriessing the energy of high speed winds in Antarctica. This multi-blade wind-turbine is featured by the presence of a stator before the rotor, which enables the turbine to give a higher power, a higher torque at a lower rotational speed than an ordinary wind air-turbine. A 3-kW AC-DC generator is driven by the air-turbine through a planetary speed-up gear of speed ratio 6. The rotational speed of this generator can automatically be kept at a desired value, even in violent blizzards by means of an electric eddy-current brake newly developed by the authors. The brake also affords a new means for converting the wind energy directly into heat through the liquid heated in the jacket of the brake-stator. The present report describes the design of the winde evaluated in wind-tunnel tests and field tests at Showa Station. The field tests have proved that a generator output of 2.4 kW can be obtained at a wind velocity of 30 m/s, and that the rotational speed of the generator can be kept at a desired stator for the wind-turnel tests and field tests at Showa Station. the rotational speed of the generator can be kept at a desired value for variable loads and wind velocities exceeding 30 m/s

A joint American-Soviet project, financed by the National

A joint American-Soviet project, financed by the National Science Foundation for measuring mass balance at the lower Ross Ice Shelf surface, began in 1976/77. The program included measurements of accretion and melting rates at the ice-water interface, structure and movement of subglacial currents, and ice core drilling through the shelf. Phase transformations were studied by special ultrasonic devices. Quartz thermometers used indicated two subglacial isothermal water layers. Ice cores from a 416 m hole revealed an upper snow-firn layer 45 m thick followed by vesicular ice down to 410 m and the lower 6 meters of water permeable ice. Core samples obtained were prepared for further chemical and isotope analyses.

Molodezhnaya Station.

The results of observing processes of snow cover metamorphism in the Molodezhnaya area are presented. The snow cover changes into firm with ice veins during the warin season. Processes of regelative recrystallization can recend during later warm periods if the given layer is in a water infiltration zone. Mechanical densification of snow cover during accumulation facilitates more intense formation of firm granules. Smoothing of the snow surface during summer slows firmification.

Glacial erosion, Abrasion, Glacier beds, Basal sliding, Models.

Most theories of glacier movement and subglacial erosion have assumed that glaciers test on rigid bedrock surfaces. While this is probably correct for much of the bed area of most modern glaciers, deformable sediments do occur beneath them and formed a substantial area of the beds of large rice sheets during glacial periods. Observations and theories are presented and reviewed about the processes of glacier crossion of rock and inhithited sediment beds both when they are frozen and unifozen. (Auth. mod.)

On the origin of stratified debris in ice cores from the bottom of the Antarctic ice sheet.

Gow, A.J., et al. *Journal of glaciology*, 1979, 23(89). MP 1272, p. 185-192, In English with French and Ger-

man summaries. 11 refs. Epstein, S., Sheehy, W. Ice cores, Drill core analysis, Sedimentation, Stratification. Freeze thaw cycles.

cation, Freeze thaw cycles.
Cores from the bottom 4.83 m of the Antarctic ice sheet at Byrd Station contain abundant stratified debris ranging from silt sized particles to cobbles. The nature and disposition of the debris, together with measurements of the physical properties of the inclosing ice, indicate that this zone of dirt-laden ice originated by "freezing-m" at the base of the ice sheet. The transition from air-rich glaenal ice to rice practically devoid of air coincided precisely with the first appearance of debris in the ice at 4.83 m above the bed. Stable-isotope studies made in conjunction with gas-content measurements also confirm the idea of incorporation of basal ice may well constitute the most diagnostic test for discriminating between debris incorporated in a melti-refreeze process and debris entrapped by purely mechanical means, e.g. shearing. We conclude from our observations on bottom cores from Byrd Station that "freezing-m" of basal debris is the major mechanism by which sediment is incordebris is the major mechanism by which sediment is incor-porated into polar see sheets—(Auth.)

Doake, C.S.M

Floating ice, Grounded ice, Radio echo soundings.

Floating ice, Grounded ice, Radio echo soundings. Polar ice is now thought to be marginally birefringent at radio echo-sounding frequencies. An experiment on the polarization behaviour of 60 MHz radio echoes from the bed of both ice shelf and land ice in Antarctica showed a marked difference in the returned polarization. It appears that differences in electrical properties or roughness of the reflecting boundary cannot explain these results. It is suggested that there is a large change in the birefringence of the ice sheet at the hinge zone, caused by the effect of tidal strain on crystal orientation. This would imput a minimum value of the radio-frequency anisotropy in permittivity for the single crystal of 0.52°. Therefore polarization changes could allow floating and grounded ice to be distinguished. (Auth.)

pollution, Heat transfer.

pollution, Heat transfer.

The ice suppression resulting from discharge of warm water into rivers during winter is analyzed with emphasis on two different cases. In Part I, the case of a thermal effluent fully mixed across the flow section is analyzed to include the effects of unsteadness in the effluent temperature and the meteorological variations. The location of the ice edge is determined either. by O C water temperature criterion or an equilibrium ice melting analysis. The choice of the applicable criterion emerges naturally from the analysis, even though the location of the ice edge may be considerably different when a steady-state analysis is done. In Part 2, the case of a side discharge of heated effluent is analyzed, also in an unsteady manner, and the effects of transverse dispersion are included in the analysis. Comparisons are made in Parts 1 and 2 to limited field data that are available.

McKim, H.I., Brockett, B.E. Water treatment, Waste treatment, Water balance, Sewage treatment, Irrigation.

Sewage treatment, Irrigation.

The water budget for a 3-6-ha test area was calculated during and two days after a 2-7-cm requirement to 993 0000 f) application of wastewater. By computing the water remaining in the soil from soil sample water content data, calculating the amount lost to evaportranspiration and measuring the undertrain flow rate, it was possible to calculate the water budget to within 95% of the actual amount applied. The accuracy in computing the soil water content is critical. In this case, a P. variation of error in the volumetric water content is equivalent to nearly one third of the total water applied.

View on the formation of saline waters in the Dry Valleys.

Torn, T., et al. Tokyo National Institute of Polar Research Memoirs. Sep. 1979. Special issue No.13. Proceedings of the Seminar III on Dry Valley Drilling Project. 1978, edited by T. Nagata, p.22-33, 13 refs. For another version of this paper see 10F-20374, or 32-3275.

Yamagata, N., Ossaka, J., Murata, S.
Water chemistry, Salt water, Drill core analysis, Ice composition, Snow composition.

A previous report by Torn et al (1977, 9E-18530) on the salt balance in the Don Juan basin pointed out the presence of calcium excess when the total salt deposits in the basin are assumed to have resulted simply from the evaporation of sea water. Concerning the evolutionary processes of saline waters in the Dry Vaileys, sources of the salts other than trapped sea water were not necessarily excluded, and sea spray, non exchange and rock weathering theories have been suggested by many investigators. This paper presents the results obtained by further examination of the processes of saline water formation, on the basis of the analytical results of the DVDP cores from the Wright Valley, the information on the chemical characteristics of the water systems in the Dry Valleys, and a recent recommassance in the Labyrinth and the Pearse Valley. It is more likely that the chemical composition of waters in these saline lakes is mainly due to the atmospheric salt rather than the modification of trapped sea salt. (Auth.)

Upper crustal structure under McMurdo Station, Antarctica, deduced from blasts during nuclear power

Flant removal.

Kaminuma, K., Tokyo National Institute of Polar Research Memoris, Sep 1979, Special issue No. 13.

Proceedings of the Seminar III on Dry Valley Drilling Project, 1978, edited by T. Nagata, p.34-41, 9 refs.

—McMurdo Station.

The upper crustal structures beneath McMurdo Station are studied, using reflected waves of blasts for dismantling the nuclear power plant in Nov. and Dec. of 1975. A three-seismograph network was installed near the Thiel Earth Sciences laboratory, and reflected waves of four blasts ont of many were successfully observed. As the distances between the blast points and seismographs were only 300 m, refracted waves were not recorded. Though the velocities of seismi, wave are not determined the arrival times of clear phases of teflected waves in approv. 0.7 sec., and thickness of the first layer is 1.2 km if the P wave velocity of the layer is assured to be 4.1 km. S. The travel time of all the well-dentified latest phase is 3.95 sec. This study suggests the presence of five layers in the upper crust. (Auth.)

Deutsch, W., Harris, H.J.H.
Permafrost structure, Electrical resistivity, Ion den-

sity (concentration), Soil chemistry, Clay minerals. Electrical conductivity and ionic composition of extracted solutions from ice-cemented permafrost from cores 8, 9, and 10 show that most of the sediments were deposited in a marine environment and that aggradation of permafrost during exposure of the sediments to subserial conditions caused ionic concentration. Influx of brines capable of moving in permafrost is also suggested. Regions of low conductivity are interpreted either as freshwater episodes or textural discontinuities. Clay mineralogy can be separated into three major assemblages corresponding to the three major lithological units. The clay minerals show little weathering and complex irregular interstratification of mica-vermiculite-montmorillonite and chlorite. (Auth.)

DVDP at the Florida State University: core storage and sample distribution.

and sample distribution.
Cassidy, D.S., Tokyo. National Institute of Polar Research. Memoirs. Sep. 1979. Special issue No. 13, Proceedings of the Seminar III on Dry Valley Drilling Project, 1978, edited by T. Nagata, p.240-245, 13 refs. Cores, Dry Valley Drilling Project.
Cores recovered by the Japan-New Zealand-United States Dry Valley Drilling Project (DVDP) in Antarctica are stored at the Florida State University's Antarctic Research Facility. More than 1100 m of DVDP drill core are stored at -23C, from which 3471 samples have been distributed to authorized investigators worldwide. All cores remain in excellent condition, and further research interest in them is invited. (Auth.)

Glacier ice, Antarctica—Vostok Station.

The ice sheet of Antarctic provides a unique opportunity to study the conservation of microorganisms under strong cooling for tens or, possibly, hundreds of years. Microbiological investigations of thickness of the glacier up to 312 meters have been carried out for the first time in Central Antarctic. It was established that the microorganism concentration in deep layers of the glacier was extremely small with fortuitous distribution along the glacier profile. The age of studied horizons with embedded viable microorganisms is 10-13 thousand years. Among the microorganisms found, the dominant ones are classified as bacteria. Microscopic fungi and yeasts were found as well. (Auth.) (Auth)

ing, Seasonal variations, Ground ice.

The performance of surface impedance and magnetic induction electromagnetic subsurface exploration techniques was studied seasonally at various sites in Alaska where termafrost and massive ground ice occurred. The methods used have greatest sensitivity within about 20 m of the surface index is, therefore, most applicable for shallow subsurface investigations. The selection of study sites was based on anticipated contrasts it electrical resistivity, between ground ice and adjacent earth materials. A magnetic induction instrument, using a separation of 3.66-m between the transmitter and receiver anticinas, in general was able to detect near-surface zones of massive ice and to provide data regarding permafrost distribution in both the Fairbanks and Prudhoe Bay areas.

treatment. Jenkins, T.F., et al, U.S. Army Cold Regions Research and Engineering Laboratory. Sep. 1979, SR 79-31, 32p. ADA-077 583.

Quarry, S.T., Iskandar, I.K., Edwards, A.P., Hare,

Waste disposal, Water treatment, Irrigation, Soil

The objective of this study was to compare different strategies of using 15N as a tracer to describe the fate of wastewater N in land application of wastewater. Four soil columns were packed with Windsor sandy loam soil and covered with forage grass. The columns were treated with 7.5 cm of either tapwater or wastewater according to four experimental strategies. ter or wastewater according to four experimental strategies. The strategies varied the treatment given the soil prior to application of the 15N label, the schedule and amounts of the applied 15N label, and the type of water used for subsequent column leaching. Soil solution at depth and leachate were analyzed weekly for concentration and 15N content of intrate and ammonium. Plant samples were obtained periodically throughout the experiment and, together with soil samples collected at the end of the experiment, analyzed for total nitrogen content and 15N/14N ratios.

Utilization of sewage sludge for terrain stabilization

Utilization of sewage sludge for terrain stabilization in cold regions. Pt. 3. Rindge, S.D., et al, U.S. Army Cold Regions Research and Engineering Laboratory. Oct. 1979, SR 79-34, 33p. ADA-077 585. Gaskin, D.A., Palazzo, A.J. Waste disposal, Sewage disposal, Soil stabilization. The authors have conducted a two year regreatation study in

Waste disposal, Sewage disposal, Soil stabilization. The authors have conducted a two-year revegetation study to assess the ability of sewage sludge applications with or without supplemental fertilizer to promote plant growth and stabilize sloping soils. The study site was a west-facing, 16 deg slope at CRREL in Hanover, New Hampshire. Eight revegetation treatments and one control were replicated three times. Treatments involved applications of dewatered, anaerobically digested sewage sludge at two rates (20 or 40 tons/acre). The sludge was applied alone or in combination with commercial fertilizers which supplied nitrogen, phosphorus and potassium or all three nutrients. The seed mixture in the treatments contained four grasses and one legume. The effects of the various treatments were determined through soil loss yields, visual grass ratings and plant yields. ratings and plant yields.

Considerations on the origin and properties of the

Shaw, G.E., Reviews of geophysics and space physics, Nov. 1979, 17(8), p.1983-1998, Refs. p.1996-1998. Aerosols, Snow composition, Ice composition, Particle size distribution.

cle size distribution. Information pertaining to acrosols and to microparticles, preserved in snow and ice on the high plateau of Antarctica, is assembled and interpreted with a diffusive transport model. The boundary conditions for the problem involve the existence of a two-mode microparticle size distribution function. The smaller (Arthen) mode likely consists of connected products from nucleation of trace gases, the particles are less than 2.3 days old and are produced locally over the ice caps at a production rate of 4x10 exp 21/g/cu/cm/s. The Arthen particles are present in concentrations of 100-1,000/cu/cm throughout the troposphere, except in the lowest few hundred meters within the present in concentrations or 100-1,000/cd cm intrognost the turbulent boundary layer, where they are depleted. The Aitken particles are probably composed of converted sulfates and hydrocarbons. Large particles approx 0.4 microm in radius are also found in Antarctica, in concentrations of 0.5 feet cent. these particles dominate the aerosol mass. The large particles are estimated to have come from (1) unidentified sulfate course, survivoles purposition to provide the particles of the provided the particles are estimated to have come from (1) unidentified sulfate of the provided the provided the particles are estimated to have come from (1) unidentified sulfate of the provided the provided the provided the particles are estimated to have come from (1) unidentified sulfate the provided the p cies are estimated to have come from (1) unicentified surface sources, (2) oceanic sources surrounding the continent, (3) arid regions in the southern hemisphere, (4) extraterrestrial sources, and (5) oases on the continent—in that order of importance. Furbulent diffusion seems to be the primary particle transport mechanism. Particle removal mechanisms are discussed.

Air cushion vehicles, Falkland Islands.

Air cushion vehicles, Falkland Islands. Built by the British Hovercraft Corporation for operation by the Falkland Island Hovercraft Detachment, the SR.N6 Mk I hovercraft's main task is to transport 12 fully equipped Royal Marines to any position in the Fall land Islands day or night in addition, the craft has been employed to support the marines on detachment for such tasks as aircraft spotting and casualty evacuation. Notable achievements of the craft include complete circumnavigation of the Falklands, either around the islands or in a figure 8 through the Falkland Sound. Many overland journeys were made. Topographical details of the Falkland Islands are discussed Following refurbishment in Fleetlands, the craft was returned to service in 1974, and has been emptoyed in driver training, demonstrations, logistics tasks, and navigational exercises. navigational exercises.

Watersheds, Drainage, Stream flow.

A drainage network map of the Caribou-Poker Creek Research Watershed, near Fairbanks, Alaska, has been used to conduct a Strahler stream order analysis and an analysis of length distri-butions of source and tributary-source links in a subarctic waterbutions of source and tributary-source links in a subarctic water-shed. The basins have very low drainage densities, ranging from 135 km sq.km to 534 km sq.km. Bifurcation ratios were higher than those found in watersheds in the continental U.S. Statistical analysis indicates that source and tributary-source links in a subarctic watershed belong to different length popula-tions, the same as found in other regions of the world. Addi-tional analysis indicates that exterior links originating on per-maffrost slopes tend to be shorter than those originating on non-permaffrost (well-drained) slopes.

Cheney, R.E., Marsh, J.G., Mognard, M.N.

Ocean currents, Spacecraft, Iceberg towing.

Ocean currents, Spacecraft, Iceberg towing.

Recent sceanographic research indicates that most of the ocean momentum is probably involved in intense rings, formed by meanders of the large streams, and in mid-ocean eddies. These rings and eddies have typical dimensions on the order of 200 km with dynamic height anomalies across them of tens of centimeters to a meter. They migrate at speeds on the order of a few misce. Current velocities as great as 3 knots have been observed in rings, and currents of 1 knot are common. Thus, the served in rings, and currents of 1 knot are common successful towing of icebergs is dependent on the ability to locate, measure, and track ocean rings and eddies. To accomplish this systematically on synoptic scales appears to be possible only by using satellite-borne radar altimeters. Ocean current and eddy structures as observed by the radar altimeters on the GEOS-3 and Seasat-1 satellites are presented and compared. The Antarctic Circumpolar Current is ideally suited for using this technique to identify, monitor and eventually map its rings and eddies on synoptic scales. (Auth. mod.)

High-force towing.

Mellor, M., Cold regions science and technology, Feb. 1980, 1(3/4), MP 1275, p.231-240, 5 refs. Iceberg towing, Loads (forces).

1980, 1(3/4), MP 1275, p.231-240, 5 refs.

Iceberg towing, Loads (forces).

Required force levels for iceberg towing at 1 knot could be at least 50 tons for protection of structures and drillships in northern waters, and around 1000 tons for iceberg exports from the Antarctic. Corresponding values of effective ("towrope") power are only 307 hp and 6140 hp, respectively. Moderately large conventional tugs typically have thrust/power (T/P) ratios of 20-25 lbf/hp with unshrouded propellers, and perhaps 30%-40% more with Kort nozzles. As tug size increases, the propeller loading usually has to increase and T/P decreases. A conventional-hull supertug capable of 1000 tons thrust would probably have T/P = 10 lbf/hp, p = 200,000 hp, and a propulsive efficiency of about 3%. Unconventional propellers, paddles, and water jets have little to offer, but efficiency could be improved with an unconventional hull that provides space for large propeller area. If an iceberg is propelled by pulling a drogue towards it, the propulsive efficiency increases as speed of the drogue decreases, but the required drogue area increases. For antarctic towing the demands exceed current capabilities for winch force, winch power and line speed. If an iceberg is towed against a bottom anchor, the propulsive efficiency is 100%, and power demands are modest. While such a system is feasible for relatively shallow waters, it would be very difficult to use in the deep oceans. For any system that has to develop very high towing forces, the tow cable itself is a problem. The safe working load of 6-in. wire rope is less than 300 tons, or 3 1/2 times less than the 1000-ton force that might be needed to move useful antarctic icebergs. The most practical expedient for antarctic towing seems to be use of multiple conventional tugs, with fewer tugs or higher speeds as the iceberg reduces its size and streamlines itself. The practical difficulty of towing antarctic icebergs may have been underestimated, and it might be worth reconsidering preliminary shaping

# 34-2446

On the size distribution of Antarctic icebergs. Neshyba, S., Cold regions science and technology, Feb. 1980, 1(3/4), p.241-248, 14 refs. Icebergs, Distribution, Models, Antarctica.

Composites are given of six reported antarctic iceberg size distributions, and theoretical Rayleigh distributions are fitted with reasonable small errors. A modal length of 0.4km is found for observations in East Antarctica; this increases to 0.7km when size data for icebergs observed by satellite in or near the packies in the Bellingshausen Sea are added. Results of model investigation of the equilibrium or standing population size distribution, based on the Gordienko observations of sizes near the force of the Shelf in a transfer and the same line Shelf in the same line Amery (e. Shelf as initial conditions and annual input together with the constraints of uniform sidewall wastage rate and that length, width ratios be maintained within the range 1 1 to 2 2 by length width ratios be maintained within the range 1 1 to 2 2 by scoberg fracturing into equal parts, show a distribution much unlike the Rayleigh in that the highest probability of occurrence is of icebergs of widths 0-0.2km. The model size distribution attains equilibrium after 21 years, at which time it is fitted very well to a Weibull distribution with parameters beta = 0.5, eta = 1 6 and gamma = 0. A method is outlined by which the size distribution of freshly-calved icebergs might be assessed for use as the initial condition to such models. (Auth.)

Perchal, R.J., U.S. Naval Oceanographic Office. Special publication, June 1975, NOO SP-265, 132p., Refs. p.59-62.

Sea ice, Ice conditions, Ice forecasting, Pack ice,

Meteorological factors, Long range forecasting, Antarctica—Ross Sea, Antarctica—McMurdo Sound.

rarctica—Ross Sea, Antarctica—McMurdo Sound. Procedures for preparing short-range (48-hour) forecasts and long-range (15- and 30- day) estimates of austral summer sea icc conditions in the western Ross Sea and McMurdo Sound are given. Background data on environmental factors of mean storm tracks, mean monthly sea level pressure (winds) and surface air temperature over the Ross Sea and austral summer icc conditions over the western Ross Sea and McMurdo Sound are given. Analyses of historical ice edge data which are based on observations taken over sixteen years from Deep Freeze 1 (1955-56) through Deep Freeze 71 (1970-71) indicate median positions of the north and south pack edges at half-monthly intervals from October through January. Ice data also include the range of locations of pack edges, distribution of pack concentrations, percentage of large floe sizes, and ice thickness. Analyses of the thickness and median extent and extremes of fast ice in McMurdo Sound are included. Selection of optimum ice routes is described, using mean ice concentrations and the percentage of large floe sizes. (Auth mod.) 34-2454

The volume results from a seminar-course organized by the Paterson Centre, Carlton University and by the Ecole Nationale des Ponts et Chaussées, Paris, and held at Ottawa in Oct. 1977. In seventeen chapters several authors deal with various aspects of road construction on freezing soils. Some of the topics in-clude. French research on frost action, laboratory simulation, soil thermal regimes, macro- and micro-mechanisms of freezing at the interface, frost penetration and frost succeptible soils, numerical applications, frost damage presention.

ing, Antarctica—Ross Ice Shelf.

New techniques that have been used to obtain a continuous recover through the whole 416-meter thickness of the Ross Ice Shelf at Camp J-9 have demonstrated that the bottom 6 meters of the tee shelf consists of sea ice. The rate of basal freezing that is forming this ice is estimated by different methods to be 2 centimeters of ice per year. The sea ice is composed of large vertical crystals which form the waffle-like lower boundary of the shelf. A distinct alignment of the crystals throughout the sea ice layer suggests the presence of persistent long-term currents beneath the ice shelf. (Auth.)

Mecent variation of ice sheet in Mizuho Plateau.
Mac, S., Tokyo. National Institute of Polar Research.
Memoirs. 1979, Special issue No.14, p.1-7, 16 refs.
Glacier flow, Ice sheets, Oxygen isotopes, Basal sliding, Antarctic—Shirase Glacier.

On the basis of a glaciological survey carried out by the Japanese Antarctic Research Expedition in Mizuho Plateau, thinning of the ice sheet in the observed area is discussed. Vertical profiles of oxygen isotope and ice temperature at Mizuho Station are explained by ice sheet thinning which commenced 100 years ago. A simple calculation of basal shear stress shows the unstable state of the ice sheet in Mizuho Plateau. (Auth.)

Rate of snow accumulation determined from oxygen isotope and stratigraphic analyses of the core from Mizuho Station, East Antarctic (extended abstract). Kato, K., et al, Tokyo. National Institute of Polar Research. Memoirs, 1979, Special issue No.14, p.88-92, X refs

Comparison of the pebble orientation in ice and deposits of the Matanuska Glacier, Alaska. Lawson, D.E., Journal of geology, Nov. 1979, 87(6), MP 1276, p.629-645, 21 refs.

Glacial deposits, Ice structure, Sediment transport.
Depositional processes and their sediment source determine the orientation of pebbles in the deposits of the Matanuska Glacier orientation of pebbles in the deposits of the Matanuska Glacier and the relationship of this orientation to the direction of ice flow. Pebble fabrics in ice-derived deposits affer from those in resedimented deposits: fabric in deposits from sediment flow, ablation of exposed basal zone ice, and the slumping and spalling of ice-cored slopes does not correspond to the ice flow direction, but is developed by these depositional processes. Pebbles in basal ice and melt-out till show a unimodal distribution of orientations, with individual observations only slightly dispersed about the mean axis. Pebble fabrics in other deposits are polymodal, with a significantly larger amount of dispersion about the mean axis. The regional pattern of mean axes of basal zone ice and melt-out till pebble fabrics approximates the local and regional trends of ice flow, but pebble imbrication in ice and sediment does not necessarily indicate the direction from which the glacier flowed. A small number of measurements of pebble orientations at many sites and the analysis of these data by the eigenvalue method appear to be suitable techthese data by the eigenvalue method appear to be suitable techniques for examining the pebble fabric of glacial deposits, but additional sedimentological data are needed to define the origins of these deposits.

Analysis of plastic shock waves in snow.

Brown, R.L., U.S. Army Cold Regions Research and Engineering Laboratory, 1979, CR 79-29, 14p., ADA-080-051, 12 refs.

Wave propagation, Snow deformation, Shock waves, Loads (forces), Analysis (mathematics).

Loads (forces), Analysis (mathematics).

An analytical study of the propagation of shock waves in snow was carried out to evaluate the response of medium density snow to high rates of loading. One solution was developed for steady shock waves, this resulted in calculation of pressure jump, density jump and stress wave speed. Correlation with available experimental data was found to be good. Noisteady shock waves were also considered in order to evaluate wave attenuation rates in snow. Very few data were available to compare with the analytical results, so no definite conclusions on the part of the study could be made. The results show, however, that shock waves that produce plastic detormation attenuate at extremely high rates and that differences in pressure between two waves are quickly chiminated within a short distance Calculations were also made to evaluate the effect of wave frequency on attenuation rates. The results show that, for plastic waves, frequency is not a predominant factor for determining attenuation rates. (Auth.)

Antaretica—deorge v1 1cc Sheir.

Electrical decressitivity measurements made on George V1 lee
Shelf have established the polar nature of antaretic ice despite
saturation by melt-water from surface melt-lakes. Previously
it has been suggested that different impurity concentrations are
responsible for the extremes in resistivity (a factor of 1,000) between temperate ice (essentially at its pressure melting point) and polarice (well below its pressure melting point). However the evidence suggests that importly levels are similar despite the leaching of contaminants by free water in temperate glaciers, a process which is absent in true polar glaciers. This implies process which is absent in true polar glaciers. This implies that, although impurities can significantly after the electrical behavior of glacier (e.e., there is a more fundamental mechanism at work. It is suggested that this process is one of recrystalliza-tion. (Auth.)

Glacial geology, Ice age theory, Geomorphology, Climatic changes, Glaciation.

matic changes, Glaciation.

The book deals with the global importance of ice and basic geological processes; causes of ice ages; effects of large-scale glaciation on environment; and environments during specific historical ice ages from Precambrian through Quaternary. It is intended to give insight toward understanding the processes and effects of the present ice age in order to interpret correctly earlier ice ages and to predict global climates over the few centuries. Antarctica is mentioned sporadically in the text and more frequently in photographs, charts, tables, and graphs.

Glaciers and environment.

Sea ice and ice sheets and their role in climatic variations

Untersteiner, N., Global Atmospheric Research Programme. GARP publications series, Apr. 1975, No.16, p.206-224, 68 refs.

Sea ice, Ice sheets, Climatic changes.

The most important variations of the atmosphere-cryosphere-hydresphere system on time scales up to 10,000 years are the annual cycle and the protonged glaciations associated with secular trends of the sea ice and snow cover. Theories of sea secular trends of the sea ice and snow cover. Theories of sea ice dynamics are still in an early stage, and concerted efforts will be needed to improve both theory and the world-wide observational monitoring of sea ice by satellite-borne, all-weather, remote sensing methods. The continental ice sheets are important features influencing the present-day general circulation of the atmosphere and the oceans (e.g. formation of bottom water around Antactica). In terms of climatic variations they are comparatively "inert", but they provide useful paleo-climatic information. Major outbreaks (surges) of antactic tie ewould have protound consequences for world climate. The search for geomorphic evidence of such events, and efforts to improve the theory of ice sheet dynamics, should be continued. (Auth.)

L-band radar images of a number of ice-covered lakes located approx 48 km northwest of Bethel, Alaska, show large differ-

ences in tadar backscatter with lakes showing homogeneous low-returns, homogeneous high-rearns and or low-returns around the lake borders and high-returns from the central areas. The patterns of the returns suggest text at a low-return make ites that the lake is troon completely to its bottom, while a highthat the lake is frozen completely to its bottom, while a high-return indicates the presence of tresh-water between the re-cover and the lake bed. This interpretation is in good agree-ment with the limited information available on lake depths in the study area and recent X-band radar observations of North Slope lakes by Seifman, Weeks and Campbell, who suggested such an interpretation. These effects are however, more strik-ing in the 1-band than in the X-band imagery. This can be ex-plained by the fact that volume inhomogeneities, such as an bubbles, with cause more scattering and conductivity losses and thus more attenuation at the shorter wavelengths (A-band, 3

Crystal alignments in the fast ice of Arctic Alaska. Weeks, W.F., et al, Journal of geophysical research, Feb. 20, 1980, 85(C2), MP 1277, p.1137-1146. For this paper in another form see 34-1379 (CR 79-22, ADA-077 188) 8 refs.

Sea ice, Ice physics, Ice crystal structure, Ocean currents.

Field observations at 60 sites located in the fast or near-fast ice along a 1200-km stretch of the north coast of Alaska between the new Serious districts observed the second factors of the coamples exhibit striking c axis alignments within the horizontal plane. In all cases the degree of preferred orientation increased with depth in the ice. Representative standard deviations around a mean direction in the horizontal plane are commonly less than 10 deg for samples collected near the bottom of the ice. The general patterns of the alignments support the correlation between the preferred c axis direction and the current direction at the ice water interface suggested by Weeks and Gow (1978). A comparison between caxis alignments and mistantianeous current measurements made at 42 locations shows that the most frequent current direction coincides withmean c axis direction. The c axis alignments are believed to be the result of geometric selection, with the most favored orientation being that in which the current flows normal to the (0001) plates of ice that comprise the dendritic sea ice seawater Field observations at 60 sites located in the fast or near-fast ice (0001) plates of ice that comprise the dendritic sea ice, seawater

34-2672

Traveling wave solutions of saturated-unsaturated

flow through porous media. Nakano, Y., Water resources research, Feb. 16, 1980, 16(1), MP 1278, p.117-122, 9 refs.

Wave propagation, Water flow.

Wave propagation, Water flow.

Traveling wave solutions to the problem of saturated insaturated flow of water through a uniform porous medium are derived, and the regularity properties of the solutions are studied. It is found that a singularity occurs in the higher-order derivatives of flux with respect to the space coordinate in the solutions at water tables and that the water tables can be generally interpreted as propagating acceleration waves of the *n*th order, where *n* is a positive integer.

34-2673

Pilot scale study of overland flow land treatment in cold climates.

Jenkins, T.F., et al, *Progress in water technology*, 1979, 11(4, 5), MP 1279, p.207-214, 11 refs. Martel, C.J.

Waste treatment, Water chemistry, Irrigation, Cold weather tests.

weather tests.

Primary and secondary wastewaters were applied to separate sections of an overland flow site. The dimensions of each section were 3 m in width by 30 m in length and the system was graded to a five percent slope. The site was planted with orchard grass and tall fescue. A one-year acclimation period was allowed to obtain a good cover. Wastewater was applied to the site for one month before onset of the study to establish a high level of microbial activity. Applied wastewater as well as surface and subsurface flows were monitored for NO-3. NH + 4. TKN, BOD, suspended solids, PH, conductivity, and total phosphorus. The results indicate excellent warm weather performance for removal of oxygen demanding substances, suspended anatter and nitrogen. Treatment efficiency of suspended solids remained high throughout the winter while treatment of BOD declined to unacceptable levels at soil temperatures below 4C. Nitrogen treatment declined rapidly below 14C. The form of introgen applied to overland flow was found to affect performance with nitrate being the less desirable form. Phosphorus treatment by overland flow was found to be about 80°, in the summer months, declining to nil during the winter.

Low-frequency surface impedance measurements at some glacial areas in the United States.

Arcone, S.A., et al. *Radio science*, Jan -Feb. 1980, 15(1), MP 1280, p.1-9, 14 refs.

Delaney, A.J Radio waves, Wave propagation, Radio communica-

tion. Measurements of apparent resistivity and phase derived from the complex surface impedance of radio waves propagating in the ground wave mode at frequencies in the radio navigational aid band (between 257 and 382 kHz) are presented. Areas encompassing between 400 and 800 sq km that covered a variety of glacial sediments, land forms, and some crystalline bedrock types were surveyed. The degree of dispersion found in resistivity values reflects the dispersion in grain size, while the average resistivity increases with mean grain size. Dielectric properties are suggested as one cause of the low phases observed over crystalline bedrock. The combination of apparent resistivity and phase data implies that the resistivity measurements

are consistent in about 50% of the areas with previous measurements of field strength attenuation performed in the AM broad-

Analysis of circulation patterns in Grays Harbor, Washington, using remote sensing techniques.

Washington, using remote sensing techniques.
Gatto, L.W., Marine geodesy, 1980, Vol.3, MP 1283, p.289-323, 45 refs.
Remote sensing, Tidal currents, Water flow.
The objective of this investigation was to analyze surface circulation patterns in Grays Harbor. Washington, during flood and obbitide, using National Aeronautics and Space Administration (NASA) aerial photographs and thermal-IR imagery and low allitude aerial photographs of uranine dye drogues. The application of LANDSAT-1 and passive microwave imagery was evaluated but did not prove useful. Water temperature, valuinty, and suspended sediment data and the results of hydraulic model studies were used to verify and supplement interpretations from the photographs and imagery. The use of remote sensing techniques in conjunction with ground truth data and hydraulic model results, when available, provides a more complete perspective of estuarine processes than is available by using conventional shipboard surveys alone.

Engineering at the ends of the earth: polar ocean technology for the 1980's. Washington, D.C., Naticnal Research Council, Assembly of Engineering, Marine Board, 1979, 74p., ADA-074 161, Refs. p.61-65. Research projects, Polar regions.

Research projects, Polar regions.

Ocean engineering operations in polar waters, particularly in the Arctic, will increase during the foreseeable future as efforts continue to recover commercially valuable resources such as petroleum, fish, and various minerals. In the Antarctic, krill resource assessment and experimental fishing projects are being undertaken by several countries in preparation for large-scale development. In addition to U.S. activities, other nations, notably Canada, the Soviet Union, Japan, West Germany, and Norway are investing substantial funds in developing polar ocean engineering technologies. This report is a review of polar ocean engineering research and technology that are considered necessary to support of commercial and scientific operations during the decade of the 1980's.

Glaciology, Exploration, Environments, Research projects.

The development of polar exploration and scientific research programs as seen through the eyes and experiences of one who participated in that development is presented. The author traces observation and measurement techniques of ice thicktraces observation and measurement techniques of ite thick-ness, core drilling, oceanography, and hydrography in Arctic areas from the late 1930's through the late 1950's. He then shifts to Antarctica to describe IGY activities and administering the post-IGY research programs and closes by suggesting sev-eral reasons why polar research should continue and the general trend the research should take

Climate, Ice cover, Snow cover, Meteorological data, Winter, United States-Alaska-Susitna River.

Basic data on the winter climate and measurements on all available show and ice cover conditions were compiled for an area able snow and the opper Sustina River basin of Alaska. The 10 years of tabulated data (from Sep. 1964 to May 1974) for 16 locations include average monthly values of air temperature, precipitation amounts fincluding total snowfall) and maximum depth of snow on the ground. Tee thickness measurements and other related winter surface conditions on rivers in the basin are included in the report. Detailed observations on physical properties of the snow cover and the rate at which soil thaws in the spring are also provided for selected stations near the area moder study. under study

ICEX: Ice and climate experiment; report of Science and Applications Working Group. Greenbelt. Mary-land, Goddard Space Flight Center, 1979, c118p., Includes separately bound synopsis of the project. merous refs

Research projects, Sea ice, Icebergs, Ice sheets, Ocean currents, Climate, Remote sensing, Spaceborne photography, Antarctica, Greenland.

In this report the various connections in both arctic and anti-retic regions between ice in its many forms and world climate are shown global heat balance effects from sea ice and the role of ice sheets in climatic processes, the hazards of ice and snow related to urban areas and the economic impact of removing these hazards, the effect of sea ice on offshore oil discoveries and recoveries, use of the fresh water in icebergs, glaciers, and snow cover. The ICEX program expects to treat all of these aspects through a multidisciplinary, international approach involving new observational tools, theoretical studies, and applications of new knowledge. The primary tool for the program is a stellite system with numerous remote sensors designed specifically for observing important features of snow, sea ice, and the ice sheets of Greenland and Antarctica tic regions between ice in its many forms and world climate are

Iceberg towing, Ice shelves, Economic development. The author sketches the uses to which man has put natural ice during the last century and this. Norway exported net to Britain to preserve flounder, haibut, and salmon, other glacier (see exporting sentures were tried, some succeeded, others did not, and as ice manufacturing became cheaper than glacier harvesting, exporting eventually ceased. During WWII the concept of an aircraft carrier made of ice was developed to the prototype stage, from this experiment emerged the material still in use pykitet, a combination of water and sawdust which, when frozen, behaves like concrete. Currently, exploitation trends toward towing bergs from the vast Antarctic resources to South America and the Middle East. As an alternative to towing, a possible water harvesting system could be submersible pumps and pipelines to tap the fresh water beneath the shelf ice. It is estimated that such a system could produce forty cubic klometers of fresh water annually from George VI Ice Shelf.

Reflection, Solar radiation, Pack ice, Mountains. Monthly mean surface albedo for the full spectral range of incoming solar radiation and average atmospheric properties is estimated for the period Apr. 1. 1974-Mar. 31, 1975. It can be considered approximately representative of average conditions in the last decade. The monthly global surface albedo, average without weighting for radiation income, ranges from 15.7% in December, with an annual average of 17.0%. This is higher than most previously published figures. The difference is partly due to the averaging method, and partly to more accurate satellite based information on snow and ice covers. Parameterized albedo values of characteristic surface types were compiled from published references. Estimates are zonally averaged separately for land and ocean in 2 deg latitudinal belts. (Auth.)

During the 1978-1979 field season, the third U.S.-Japan joint program entitled "Antarctic search for meteorites" was carried out on the plateau side of the Alian Hills in South Victoria Land. This program included a glaciological study to elucidate the mechanism of accumulation of a large number of meteorites in the bare ice area. In Dec. 1978, a triangulation chain with 20 stations, 15 km in length, was newly established in the Alian Hills bare rec field to investigate the ice flow. Values of elevation and coordinates (X,Y) of all stations are tabulated. (Authorized)

SAT, Antarctica—Filchner Ice Shelf, Antarctica—Ronne Ice Shelf.

Ronne fee Shelf.

Satellite images of Ronne and Filchner ice shelves show a variety of surface features, many of which are believed to indicate flow lines in the ice. Sufficient imagery is now available from Landsat satellites to plot these features from mosaics. Although some of the features have been recognized from aircraft, it was not until an overall view was provided that the true extent of the features and their relationship to the major ice streams became apparent. Using this evidence together with published ice thickness data from radio echo and seismic sounding, flow patterns within the ice shelves and tributary glaciers can be inferred. Flow lines show that the major input to Filchner lee Shelf is from Slessor and Recovery glaciers, while Support Force Glacier contributes less than one third. On Ronne Ice Shelf, flow lines indicate that most of the ice comes from Foundation lee Stream in the east and from Evans Ice Stream and three other ice streams in the west; there is a large area of relatively slow moving ice in between. Ice thickness and velocity data are now needed in order to quantify the ice discharge. However, satellite imagery can be used to estimate the relative importance of glaciers feeding ice shelves and to delineate the flow patterns within them. (Auth.)

Ice flow along the Byrd Station strain network, Antarctica.

Whillans, I.M., Journal of glaciology, 1979, 24(90), p.15-28, In English with French and German summar-

Ice sheets, Ice creep, Strains, Ice mechanics, Models, Antarctics—Byrd Station.

Antarctica—Byrd Station.

The flow of the Antarctic ice sheet near Byrd Station is modeled using surface net accumulation-rate data, surface strain-rate data, and core-hole tilting results. The model empirically allows for the progressive development of ice fabric and for values of the vertical strain-rate nearer to zero at depth, and adjusts the strain-rates according to the effect of the climatic warming at the beginning of the Holocene. The validity of the model is supported by the agreements between calculated bed form and that measured by radar sounding, and between calculated and measured present-day ice-sheet thinning-rates. The ice was about 200 m thicker before thinning. The depth-age relationship for the Byrd Station ice core shows that the climatic change represented by the oxygen isotopic ratio of the ice began some 5,000 years sooner than in north Greenland but ended at about the same time. Thinning of the ice sheet in Mizuho Plateau, East

Naruse, R., Journal of glaciology, 1979, 24(90), p. 45-52. In English with French and German summaries. 31 refs.

Ice sheets, Ice cover thickness, Snow accumulation, Antarctica—Mizuho Plateau.

Antarctica—Mizuno Piateau.

Surveys of a triangulation chain 2:0 km in length were carried out in Dec. 1969 and Dec. 1973-Jan. 1974 along the surface contour lines from 2,250 m to 2,600 m in Mizuho Plateau. Horizontal velocities were obtained as small values near the Yamato Mountains, while they had maxima of more than 20 m/a around 39E 72S in the drainage of the Shirase Glacier.

Submergence velocities showed large values in the region along 728 from 39E castward to 43E. The amount of snow accumulation there, of average thickness 0.2 m/a, was not enough to compensate for the deficit of the ice mass caused by the submergence flow. It follows that the ice sheet was thinning there. It is suggested that the ice sheet of Miruho Plateau is in an unstable condition as a whole. (Auth.)

34-2816

Basal sliding of a thinning ice sheet, Mizuho Plateau, East Antarctica.

Mae, S., Journal of glaciology, 1979, 24(90), p.53-61, In English with French and German summaries. 20

Ice sheets, Basal sliding, Ice cover thickness, Antarctica-Mizuho Plateau.

tica—Mizuho Plateau.

The Japanese Antaretic Research Expedition observed the thinning of the ice sheet, about 70 cm/year, in Mizuho Plateau. The thinning observed is analyzed using an equation of mass continuity. The result of the analysis indicates that the thinning is predominantly caused by the basal sliding and the basal sliding velocity is about 10 m/year. This sliding velocity is compared with the basal sliding velocity obtained by the calculation of the velocity due to internal deformation of the ice sheet. (Auth.)

Characteristics of ice flow in Marie Byrd Land, An-

tarctica. Ruse (1) Academy Jacobings 1979 24(30) p.o.s-75, In English with French and German summaries.

Ice sheets, Glacier flow, Radio echo soundings, Antarctica-Marie Byrd Land.

tarctica—Marie Byrd Land.

Extensive radio echo-sounding has mapped the part of West Antarctica between Byrd Station, the Whitmore Mountains, the Transantarctic Mountains, and the Ross Ice Shelf. The ice sheet in this area is dominated by five major sub-parallel ice streams (A-E), which are up to 100 km wide and extend inland from the ground line of the Ross Ice Shelf for about 400 km. Their positions have been determined by crevassing seen on radio echo-sounding records, trimetrogon photographs, and Landsat imagery. The ice streams are characterized by their lat transverse cross-sections, while the intervening ice sheet exhibits domes and ridges. Ice flow lines are defined from the ice-surface contour pattern and the trend of the ice streams. It is apparent from this work that the flow line passing through Byrd Station joins ice stream D. The bedrock of the area is relatively smooth near the Ross Ice Shelf, becoming rougher near Byrd Station and especially so near the Whitmore Mountains. Bedrock troughs, which control the positions of the ice streams are believed to have a tectionic origin. In this paper the role of the ice streams in the glaciological regime of West Antarctica is investigated from radio-echo data and estimates of balance velocity, basal shear stress, and basal temperatures. (Auth.) (Auth.)

Measured velocities of interior East Antarctica and the state of mass balance within the I.A.G.P. area. Young, N.W., Journal of glaciology, 1979, 24(90), p.77-87, In English with French and German summaries. 20 refs.

Snow accumulation, Ice sheets, Mass balance, Antarctica-Fast Anterctica.

Recent measurements of accumulation and ice velocity made in the interior of East Antarctica indicate that a large sector between 80E and 135E and north of 80S has close to a zero net mass budget. This sector is within the study area for the International Antarctic Gaicological Project (1.A.G.P.) and covers a major portion of the area indicated for projects of special emphasis. Velocity measurements were made at a number of points on a traverse route from Mirray on the coast to Dome "C" in the interior. Accumulation measurements were made along this and other traverse routes, extending as far as Vostok by a number of methods. These included stake, stratigraphic, isotopic, and total beta-decay observations. The better accumulation data have allowed a review of the total mass input to be made. The true mass budget has been estimated by comparing velocities along the traverse routes and on a number of the outlet glaciers. For this purpose the area was divided into a number of drainage basins according to outlet at the coast. The area of about 1 million sq km and 150 Gt/a flux input is drained primarily by three glacier systems of which the Totten accounts for 40% of the flux from 55% of the area; the Vanderford 20% from 15%; and the Scott/Denman 20% from 20%. (Auth.) 34-2819

Results from the I.A.G.P. flow-line study inland of Casey, Wilkes Land, Antarctica.
Budd, W.F., et al, *Journal of glaciology*, 1979, 24(90), p.89-101, In English with French and German summaries. 28 refs. Young, N.W.

Young, N.W. Ice sheets, Flow rate, Ice cover thickness, Ice mechanics, Antarctica—Wilkes Land.
In order to determine accurate velocities of the sheet in the interior of Antarctica, approximately along a flow lieg, a dealed trilateration net was established in 1973 from the summit of Law Dome (100 km inland) to about 250 km south near the 2,00 m contour. The net consisted of a double line of markers approximately 10 km apart with all sides and diagonals of the quadrilaterals measured with tellurometers. In addition, satellite doppler survey positions and astronomical azimuths were determined at about 50 km intervals to control the net on the large scale. Other measurements carried out en route in-

cluded continuous barometric levelling, radio echo-sounding, gravimetry, accumulation, and surface sampling. The route was close to an earlier traverse route which reached Vostok in was close to an earlier traverse route which reached Vostok in 1962 and along which other data, including snow-surface temperatures and temperature-depth gradients, were determined. The trilateration net was re-surveyed in 1975, allowing velocities and strain-rates to be determined. The results indicate that the ice sheet is close to balance in this region. Therefore, the measured velocities were used together with "balance velocities", further inland, to carry out a modelling study of a flow line, to derive particle trajectories, ages, temperature profiles, and "dynamics velocities", from a flow law. The results provide further insight into the dynamics and flow properties of the ice sheet. (Auth.) sheet (Auth)

Ice flow along an I.A.G.P. flow line and interpretation of data from an ice core in Terre Adélie, Antarctica. Raynaud, D., et al, Journal of glaciology, 1979, 24(90), p.103-115. In English with French and German sum-

maries. 24 refs. Lorius, C., Budd, W.F., Young, N.W.

Ice sheets, Ice cores, Drill core analysis, Climatic changes, Antarctica—Adélie Coast.

changes, Antarctica—Adelie Coast.

An ace core has been obtained to the bedrock about 300 m deep in Terra Adelie S km inhaed from the most. Stable rootings and gas content have been measured over the length of the core. The results have been interpreted in terms of the temperature and elevation of origin of the tee further inland on the ice sheet the first of the coast and account of the coast and account of the coast and account of the coast has been modelled to determine the ages and particle trajectories of the ice for present conditions. It has been found that the upper isotope and gas-content values in the core can be matched with the resent regime, using a base for ice flow above the present bed which is suggested by moraine in the ice core. The ice in the layer from the 200 m depth, where the age is apparently more than 5,000 years, to the 250 m depth, appears to have originated from conditions which differ substantially from those existing on the present inland ice-sheet surface. The results give an indication of a colder climate and greater ice-sheet thickness in the past. (Auth.)

Ice-sheet flow properties derived from bore-hole shear measurements combined with ice-core studies. Russell-Head, D.S., et al, *Journal of glaciology*, 1979, 24(90), p.117-130, in English with French and German summaries. 28 refs.

Ice sheets, Ice mechanics, Ice structure, Ice deforma-tion, Antarctica—Law Dome.

ton, Antarctica—Law Dome.

Samples of a Law Dome ice core were subjected to simple shear at temperatures and deviatoric stresses which match the in situ conditions of the ice sheet. Similar studies of randomly-oriented laboratory-made polycrystalline ice were undertaken. Long-term tests, lasting for up to two years, were required to determine minimum strain-rates. The flow law for the anisotropic ice was thus determined as a function of that for the isotropic ice together with a measure of c-axis fabric strength perpendicular to the shear plane. Core studies indicate that the upper part of the ice sheet has a polycrystalline structure appropriate to the surface longitudinal stress. Deeper in the core a strong concentration of near-vertical c-axes develops lec having very large crystals with multiple maxime fabrics was found in the lower quarter of the ice thickness. Shear measurements in the bore hole indicate the existence of high strain-rates in the zone of vertical c-axes, and of lower shear-rates below that level. The low values of shear-rates in the basal region region cannot be explained in terms of crystallographic changes alone, and therefore it is inferred that the shear stress decreases in this layer—a result which also provides a possible explanation in this layer—a result which also provides a possible explanation for the development of the observed basal crystal structure.

Relationship of ultrasonic velocities to c-axis fabrics and relaxation characteristics of ice cores from Byrd Station, Antarctica.

Gow, A.J., et al, Journal of glaciology, 1979, 24(90), MP 1282, p.147-153. In English with French and German summaries. 12 refs.

Kohnen, H. Ice sheets, Ice mechanics, Drill core analysis, Relaxation (mechanics), Ultrasonic tests, Antarctica-Byrd

Deep cores from Byrd Station were used to calibrate an ultra-sonic technique of evaluating crystal anisotropy in the antarctic ice sheet. Velocities measured parallel and perpendicular to the vertical axis of the cores yielded data in excellent agreement with the observed c-axis fabric profile and with the in-situ P-wave velocity profile measured parallel to the bore-hole axis by Bentley. Velocity differences in excess of 140 m/s for cores from below 1,300 m attest to the tight clustering of c axes of

The same the second will be at a shirt

crystals about the vertical especially in the zone 1,300-1,800 m. A small but significant decline in vertical velocity with ageing of the core, as deduced from Bentley's down-hole data, is attributed to the formation of oriented cracks that occur in the ice cores as they relay from environmental stresses. This investigation of cores from the 2,164 in thick ice sheet at Byid Station establishes the ultrasonic technique as a viable method of monitoring relayation characteristics of drilled cores and for determining the gross fronds of class orientation in ice sheets. The Bird Station data, in conjunction with Barkov's investigation of deep cores from Vostok East Antarctica, also indicate that crystal amsofropy in the antarctic rice sheet is dominated by a clustering of classic about a vertical symmetry axis. (Auth.) crystals about the vertical 'especially in the zone 1,300-1,800 m.

34-2824

Margin of the Greenland ice sheet at Isua.
Colbeck, S.C., et al. Journal of glaciology, 1979, 24(90). MP 1281, p.155-165, In English with French and German summaries. 7 refs. Gow, AJ

Ice sheets, Ice edge, Drill core analysis, Ice structure.

Ice sheets, Ice edge. Drill core analysis, Ice structure. Field studies at a particular place at the margin of the Greenland ice sheet have provided information about the ice sheet. The temperatures were measured in five drill holes, two of which reached dhe unfroren area of basal melting. Surface water entired these two bore holes, reaching the base in one, but remaining 59 in above the base in the other. The existence of this water conduit or fracture at 240 in depth, the calculated temperature profiles, and the local bedrock configuration suggest arrange of stationary ice overridden by the ice sheet. This situation suggests creep rupture at depth in the ice sheet. Ice-labric analysis made above 240 in depth shows patterns similar to fibrics cleswhere near the margin in zones of low deviators stress. Unfortunately, no cores were obtained below that depth where stationary ice may exist.

34-2825

Dynamics of marine ice sheets.

Fhomas, R.H., Journal of glaciology, 1979, 24(90), p.167-177, in English with French and German summaries. 22 refs

Ice sheets. Dynamic properties, Ice shelves, Mass balance.

Marine (ce sheets rest on land that, for the most part, is below sea-level. At the grounding line there is a transition from reshere dynamics to ree-shelf dynamics, and the creep-thinning rate in this region is very sensitive to sea depth, rising sea-level. rate in this region is very sensitive to sea depth, rising sea-level causes increased dimning-rates and grounding-line retreat, but failing sea-level has the reverse effect. If the bedrock slopes down rowards the centre of the ice sheet, there may be only two whalle modes—a freely-floating ice shell or a marine ree sheet that extends to the edge of the continental shelf. The only current example of marine ice sheets is the West Antarctic ice sheet. This is buttessed by the Ross and Ronne Ice Shelves, and if climatic warning were to prohibit the existence of these ice shelves, then the ice sheet now be advancing into parts of the Ross Ice Shelf. Such advance, however, would not ensure the security of the ice sheet since ice streams that drain to the north appear to flow directly into the sea with little or no ice shelf to butters them. If these ice streams do not flow over a sufficiently high bedrock still, then they provide the most likely avenues for ice-sheet retreat. (Auth. mod.) 34-2826

Formation, flow, and disintegration of ice shelves Robin G de Q., Journal of glaciology, 1979, 24(90), p.259-271, In English with French and German summaries 33 refs

Ice shelves, Ice formation, Ice creep, Ocean currents.

lee shelves, Ice formation, Ice creep, Ocean currents, her shelves may develop either by continued thickening of sea ice that is held last to the shore, or by the seaward extension of inland ice. For both processes, as well as for an understanding of ablation and of accumulation at the bottom surface of ice shelves, we need to understand melting and freezing processes in relation to salinity, temperature, and pressure. Consideration of these factors shows that basal melting beneath the thicker parts of ice shelves in much greater than is generally appreciated. This could be sufficient to bring the estimated mass balance of Antarctica into approximate equilibrium. It

appears that most antarctic ice shelves are dependent on the appears that most antarets rec shelves are dependent on the supply of inland rec for their continued existence. However, the thick layer of sea ice beneath the Amery Ice Shelf is readily explained in terms of sub-ice water circulation. I ransport of heat and mass by water motion beneath rec shelves has the potential to change ice thicknesses by simila, amounts to that caused by internal deformation of the ice shelf. Bottom freezing due to thermal conduction throughout the ice shelf is of minor importance. (Auth.)

Thomas, R.H., Journal of glaciology, 1979, 24(90), p 273-286, In English with French and German summaries. 46 refs.

Ice sheets, Ice shelves, Calving.

The sheets, Ice shelves, Calving.

Ice shelves form where ice flows off the antarctic ice sheet onto the sea to produce rather flat slabs of floating ice which, for the theoretican, are the simplest of all large masses. Boundary conditions are well defined, conditions change very slowly over distances that are large compared with ice thickness, and horizontal velocities are independent of depth. Unconfined ice shelves can be used as giant creep machines to investigate the cellow law at low stresses. Further inland, where movement is hampered by obstructions such as grounded ice rises and by shear between the ice shelf and its sides, the ice shelf transitis a back-pressure which tends to restrict drainage from the ice sheets that feed it. Wastage from ice shelves is principally by calving and by bottom melting. There has been no direct measurement of bottom-melting rates, but indirect evidence suggests that, near the seaward edges of ice shelves, bottom-melting rates may exceed one meter per year, with significant melting within about 100 km of the ice front. Further inland there may be bottom freezing, and analysis of cores taken from the Amery Ice Shelf indicate that bottom-freezing rates average 0.5 m a over a distance of 200 km. Such high freezing-rates are probably exceptional, and, beneath the Ross Ice Shelf, freezing appears to be insignificant even at a distance of 400 km from the ce front. (Auth mod.)

34-2831

Ice-thickness patterns and the dynamics of the Ross

34-2831

1ce-thickness patterns and the dynamics of the Ross Ice Shelf, Antarctica.

Bentley, C.R., et al. Journal of glaciology. 1979, 24(90), p.287-294, In English with French and German summaries. 11 refs.

Clough, J.W., Jezek, K.C., Shabtaie, S.
Ice shelves, Ice cover thickness, Flow measurement, Antarctica—Ross Ice Shelf.

As part of the Ross Ice Shelf Geophysical and Glaciological Survey, a detailed map of ice thickness has been produced from airborne radar measurements closely tied to the network of survey stations on the ice-shelf surface. The map, drawn with a 20 m contour interval, reveals a highly complex pattern of thickness variations reflecting presumably, at least in part, complex ice-shelf dynamics. Many features of the thickness variation pattern appear to be associated with zones of grounded ice, but not all. Features of interest include many ice thickness minima, with closures up to 120 m, a narrow, greatly elongated ridge-trough system 450 km or more in length; a few ice thickness maxima, steep regional gradients of 10 m km in freely floating ice; highly contorted contours suggesting a large-scale "turbulence", and at least two remarkable step-like changes in ite dynamic system, so that the ice shelf as a whole suggests a state of rather rapid change. Flow-bands constructed on the basis of the strengths of the echo from the ice-water interface clearly delineate the outlow from the main East Antarctic outlet glaciers in the grid eastern part of the shelf. (Auth mod.) 34-2832.

Dynamics of the Ross Ice Shelf revealed by radio echo-sounding.

Ice shelves. Dynamic properties. Radio echo soundings, Antarctica-Ross Ice Shelf.

ings, Antarctica—Koss Tee Sheff.

Radio-echo data have yielded information on the dynamics of the Ross Ice Sheff. Distinctive features present on the radio-ceho records have been used to delineate several flow lines on the ice sheff. Measurement of the power returned from the ice-water interface has revealed regional variations in the r.i. dielectric loss of Ross Ice Sheff ice. These variations are used to indicate zones of bottom melting and freezing. (Auth.)

Lateral density differences from seismic measurements at a site on the Ross Ice Shelf, Antarctica. Kirchner, J.F., et al, *Journal of glaciology*, 1979, 24(90), p.309-312, In English with French and Ger-

man summaries. 6 refs. Bentley, C.R., Robertson, J.D.

Seismic surveys, Ice shelves, Antarctica-Ross Ice

Seismic compressional-wave data from short refraction shoot-ing carried out during the 1974-75 and 1976-77 seasons at 1-9, the site of the Ross lee Shelf Drilling Project, have been com-pared Significant dissimilarities were found to exist between pared. Significant dissimilarities were found to exist between the two sets of data. The measurements were made at locations about 2 km apart, with three unreversed profiles 60 degapart recorded during the 1976-77 season and one unreversed profile during the 1974-75 season. The resulting velocity-depth profiles, and hence the derived density-depth profiles, differ by as much as 8%. The density difference is believed to

be due to the passage of the ice through the high-stress system associated with the interaction between lee Stream B. flowing in from the West Antarctic ree sheet, and the Ross fee Shelf. A reversed refraction profile carried out at station B.C. about 30 km upstream, shows evidence of dipping layers that may be similarly caused. (Auth. mod.)

Seismic short-refraction studies on the Ross Ice Shelf, Antarctica.

Bentley, C.R

Seismic surveys, Ice shelves, Antarctica-Ross Ice

Shelf.

Seisme short-refraction studies were carried out at five stations on the Ross Ice Shelf during the 1976-77 summer season as part of the comprehensive Ross Ice Shelf Geophysical and Glaciological Survey. Measurements of the velocities of compressional waves were made at each location. Compressional wave velocities were measured along inore than one azimuth at three sites, and shear wave velocities both components) at two Travel-time curves were fitted to an exponential expression by means of a non-linear least-squares regression technique. The errors in the apparent velocities are estimated to be about 50 m s at short distances, diminishing to about 10 m s near the ends of the profiles. Compressional-wave velocities show only slight variations with azimuth and only over certain depth intervals. Showing that constant-velocity surfaces are essentially horizontal. Shear-wave velocities, however, exhibit large variations according to azimuth and polarization, indicating that transverse isotropy is violated at least in the upper 30-40 m of the ice shelf. It is believed that the amsotropy is caused by structural details in the firip perhaps modified by preferred crystal orientation and that it may arise at least partly from anisotropic stresses in the ice shelf. Electromagnetic prospecting, Crevasses, Bottom topography, Ice shelves, Antarctica—Ross Ice Shelf. the tromagnetic prospecting, crevasses, bottom topography, Ice shelves, Antarctica—Ross Ice Shelf. During the 1976-77 season of the Ross Ice Shelf Geophysical and Glaciological Survey, a series of vertical electromagnetic sounding profiles of subsurface features was completed at station 1-9. The survey comprised three five-kilometer northwest-southeast profiles separated by one kilometer and six two-kilometer northeast-southwest profiles, and was carried out on the surface using 35 MHz and 50 MHz radar systems. Folded-dipole antennae were used and oriented to detect reflectors both along and perpendicular to the profile path. This was done to facilitate the interpretation of the data, which indicated a complex system of bottom crevasses. Measurements of the positions, heights, and shapes of these crevasses showed at least two sets of crevasses varying in both strike and size. The larger crevasses, about 120 m high and oriented more or less normal to the flow direction are probably associated with the movement of the stream B across the grounding line between the West Antarctic ice sheet and the Ross lee Shelf. A satisfactory explanation for the secondary set of crevasses, about 60 m high and forming an angle of 60 deg with the first set, has not yet been found. (Auth.)

Bentley, C.R.

Ice shelves, Mass balance, Ice bottom surface, Ice temperature, Electrical resistivity, Antarctica—Ross

Ice Shelf.
Electrical resistivity sounding, using the four-electrode Schlumberger array, has been carried out at 11 locations on the Ross Ice Shelf. The apparent resistivity curves generally show four characteristic zones. The first, at distances from 1 to 10 m, reflects the near-surface zone of seasonal temperature changes and inhomogeneities. The second zone, from 10 m to 100 m, reflects primarily the uncreasing density with depth in the upper 50 m of the ice shelf, modified, in some locations, by temperature variations. The third zone, from 100 m to a distance roughly equal to the ice thickness, is affected principally by the temperature gradient in the solid ice. In the fourth zone, at distances greater than approximately twice the ice thickness, the apparent resistivity usually decreases rapidly with distance, owing to the highly conductive sea-water beneath the ice shelf. At some stations associated with ice streams and outlet glaciers, however, an increase at large spacings indicates much more resistive basal ice. Using data from seven locations on the grid eastern half of the shelf that do not show obvious evidence of a basal resistive zone, including temperatures to 100 m at two castern nail of the shelf that do not show obvious evidence of a basal resistive zone, including temperatures to 100 m at two of the sites, the mass-balance rate at the bottom of the ice is estimated to be within a few tenths of a meter per year of zero at distances between go and 530 km from the ice front, assuming steady-state condition over most of the ice shelf. (Authmod.)

Antarctica—Ross Ice Shelf.

Seasonal variations in sodium concentrations have been measured on surface-pit snow samples and on firn and ice core samples from the Ross Ice Shelf. Antarctica—The predominant source for the Na is sea salt, indicated by greater concentration levels at seaward sites. Small Al concentrations show that the input of continental dust is comparable to that at inland antarctic locations, and that dust contributes only a negligibly small fraction of the Na on the shelf. Maximum Na concentrations occur in the winter or early spring, as is the case for Greenland ice. The annual accumulation rate at 1-9, determined by counting Na concentration peaks with depth, is 90 kg/sq m/yr, in agreement with rates determined radiometrically. Annual cycles in Na concentration are also detectable at depth in the 1-9 (ice core. It is suggested that Na concentration is a useful diagnostic criterion for distinguishing between East Antarctic ice. West Antarctic ice, and ice that fell as snow on the shelf itself. The transition between snow that is chemically characteristic of the ice-shelf regime to snow of an inland regime is expected to occur near the 500 m elevation contour. This position is up to 200 km inland of the grounding line. (Auth. mod.) 34-2838

The Weddell Sea pack ice undergoes several unique advanceretreat characteristics related to the clockwise transport in the
Weddell Gyre, the physical setting for the pack ice, and the free
boundary with the oceans to the north. From satellite-derived
ice charts, the annual cycle of the pack ice advance and retreat
is depicted. The Weddell pack advance is characterized by a
strong east-moving component as well as the north advance
seen in other regions such as East Antarctica. Physical characteristics of the pack ice at the summer linimum ice edge are
presented. Indications are that deformation is a significant
component of the ice accumulation, deformed ice accounting
for c. 15 to 20% of the area covered in the year-round pack.
Ablation characteristics are inferred from observations made
during field work and from satellite imagery. These observasitions indicate that surface-melt ablation typically seen on Arctic
pack is not seen on the Weddell pack inside the summer edge.
Using the physical-property data and transport inferred from
ship and iceberg drifts, a new annual ice accumulation > 3 m is
inferred over the continental shelf in the South compared to <2
m previously estimated. The implication is that salt flux into
the ocean over the shelf may be significantly larger, thereby
increasing the production of Western Shelf Water, a component
of Antarctic Bottom Water. (Auth.)

Extract from the annual report: Antarctic Division

Department of Science - Antarctic Divi-Australia sion, Canberra, Australian Government Publishing Service, 1979, 23p

Research projects, Glaciology, Antarctica

Administrative and research activities of the Antarctic Division are discussed. The Division continued to provide support for the Australian National Antarctic Research Expeditions and to undertake its own antarctic and Australia based research in and create its own antarctic and system asset research in glacinlegs, upper-atmospheric physics, cosmic rays, hology and medicine. Programs in these areas are reviewed and accomplishments in instrumentation, engineering, construction and logistics described

14.2001

Gravity survey of the Taylor Glacier, Victoria Land.

Stern, T.A., Victoria University of Wellington, Antarctic data series, Mar. 1978, No.5, 12p., Geology Department Publication No.8, 9 refs.

DGS, G(890) qV666a Gravity anomalies, Glacier ice, Ice cover thickness, Glacier flow, Antarctica—Taylor Glacier.

Glacier flow, Antarctica—Taylor Glacier.

Gravity observations from the Taylor glacier region are reported. Regional Bouguer anomalies were calculated for bedrock stations from Lake Fryxell to the Upper Taylor Glacier,
and reach a maximum of -139 mgal. Residual Bouguer anomaties were calculated along six lines transverse to the ice flow
to determine tee thickness, anomalies of up to -62 mgal were
obtained. For four of the lines ice thickness was determined orialized for four of the times leef intensives was determined assuming the glacier was underfain by bedrock of density 2.80 Mg cu in for the other two lines, ice thickness from radio echo-sounding allowed interpretation to include a subglacial sediment layer. The largest anomaly implies an ice thickness of 1100 in underfain by 600 in of sediment, and the ice becomes progressively thinner towards the snout. The shape of the inprogressively thinner towards the shout. The shape of the in-ferred ice-bedrock interface across the glacter varies from pro-file to profile, but is generally U-shaped. (Auth.)

magnetic properties

The object of the CRREL study is 'o: (a) determine the cause of the significant relief which exists under the fast ice, (b) measure the variations in the relief under fast ice, using electromagnetic echo sounding, (c) determine if the under-ice relief is a series of individual pockets or consists of long rills. (d) estimate the quantity of oil which could pool up in the under-ice depressions should oil be released under the ice cover (e) we impulse radar to study the electromagnetic properties and anisotropy of sea ice. Initial results from using a polarized radar antenna in the air from the NOAA helicopter indicate that the c-axis anisotropy can be determined from the air. Because this anisotrom is related to current direction, it should be possible to measure, from an airborne platform, the current direction at the ice water interface

34-3054

Anisotropic properties of sea ice in the 50-150 MHz

Koyaes A et al Environmental assessment of the Alaskan continental shelf, Vol. 8, Transport. Principal investigators' annual reports for the year ending March 1979, Boulder, Colorado, Outer Continental Shelf Environmental Assessment Program, Oct 1979, p.324-353, 4 refs. Morey, R.M.

Sea ice, Ice electrical properties. Anisotropy, Ice crystal structure, Electromagnetic properties, Ocean

currents, Remote sensing.
Results of impulse radar studies of sea ice near Prudhoe Bay. Alaska, show that where there is a preferred current direction

under the ice cost the crystal structure of the ice becomes highly ordered. This includes a crystal structure with a preferred horizontal c-axis that is oriented parallel with the local current. The readia studies show that this structure behaves as an anisotropic delectric. The result is that when electromagnetic energy is radiated from a dipole anienna in which the I-field is oriented perpendicular with the caxis azimuth motioni reflection is detected. It was also found that the frequency dispersion of anisotropic sea ice varies in the horizontal plane and is related to the average bulk brince volume of the ce. The bulk dielectric constant of the ice, as determined from impulse travel time, shows little correlation with the coefficient of anisotropy.

The objective of CRREL's subsea permafrost program is to obtain information on the distribution and properties of permafrost beneath the Beaufort Sea. We are currently acquiring information on the distribution of ice-bonded permafrost from analysis of the velocity structure of commercial seismic records. This report summarizes the results of all studies to date, includ-Into report summarizes the results of all studies to date, including engineering property analysis and preliminary interpreta-tion of seismic data. Emphasis is placed on results that are relevant to offshore development of this region. Discussion of the CRREL drilling and laboratory program represents the most current interpretation of these data.

"NIPR-I," a new plankton sampler under sea ice.
Fukuchi, M., et al. *Plankton Society of Japan. Bulle-*tin. Dec. 1979, 26(2), p.104-109, 6 refs.
Tanimura, A., Hoshiai, T.

Samplers, Plankton, Sea ice.

Samplers, Plankton, Sea ice. A plankton sampler was devised to collect zooplankton under the sea ice. The sampler is composed of a cylindrical part (24 cm x 57.5 cm) and a conical plankton net (20 cm x 39 cm). A propeller and an electric motor which drives the propeller are installed inside the cylinder and the plankton net is attached at the posterior end of the cylinder. The plankters are taken into the sampler by a current caused by the rotating propeller and filtered by the plankton net. The sampler is not towed, but is operated as it is suspended horizontally at desired depths under the sea ice. The sampler is of simple structure, inexpensive, light enough for one-man operation. The usefulness of this sampler was shown by the field observations in the Lutzow-Molim Bay, Antarctica, and Lake Saroma, Hokkaido, Japan The problems to be solved for the quantitative investigations are also identified. This sampler is named "NIPR-I". (Auth.)

Results of the most recent studies of melting conditions and runoff around the periphery of Antarctica are reviewed. Particular interest attaches to work done in 1769-70 and 1972-73 in Enderby Land in the Molodezhnaya area. A method of determining runoff area is proposed, the structure of heat balance of the melting ice surface discussed, a quantitative assessment of runoff volume done, and recommendations for runoff explorations.

Jesses Lice sheets, Ice cores, Ice dating, Aerosols, Dust, Condensation nuclei, Ice crystal growth, Antarctica— Byrd Station.

The significance of soluble and insoluble microparticles and oxygen isotopes for paleoclimatological studies is discussed.

Concentration, size distribution and composition of dust were studied in drill cores from the antarctic ice sheet. Electron microscope investigations of snow crystals revealed aerosol distributton, with larger sizes in centers and smaller ones dispersed throughout the crystals: the smaller the condensation nuclei sizes, the larger their quantities. Cyclic variations of dust par-ticle concentrations were observed in Byrd Station samples. It is suggested that this cyclicity can be used in snow-ice stratigraphy problems.

Glacier flow, Antarctica-Allan Hills.

Glacier flow, Antarctica—Allan Hills.

Against a long mountain barrier the antarctic ice sheet forms two types of regime: fan-shaped zones from which ice is drained into glaciers passing through the range and somewhat higheralitude stagnant zones where ice is trapped against the barrier. The Allan Hills site at which a concentration of meteorites was found in field season 1976-77 appears to be of the latter type. Field collections were made at the Allan Hills location again during the 1977-78 field season; 311 specimens were collected. Meteorites were found upon the upper and lower limbs of a monocline described by the ice surface, probably caused by a rocky ridge over which the ice is flowing. Meteorites are apparently expised first on the upper limb by ablation and then carried to the lower limb, where they remain because the ice of the lower limb, under the proper limb. In addition to the meteorites recovered at Allan Hills. In laddition to the meteorites recovered at Allan Hills, a nickel-iron meteorite was discontacted by another field party in lower Victoria Valley. (Auth. mod.)

Studies on interaction between wind and dry snow

Kobayashi, S., Hokkaido University, Sapporo, Japan,

Robayashi, S. Hokkaido Chiversiy, Sapporo, Japan. Institute of Low Temperature Science. Contribution. Scries A, 1979, No.29, 64p., Refs. p.61-64.

Snow surface, Ice surface, Wind factors, Wind velocity, Topography, Drift, Erosion, Snow air interface, Boundary layer, Antarctica—Mizuho Plateau.

face, Boundary layer, Antarctica—Mizuho Plateau, interaction between the wind and the surface of dry snow and bare ice has been studied by analyzing systematic and quantitative data obtained from field and laboratory researches on the formation of snow waves, which represent one of a variety of deposition crossion patterns (waves, ripples, barchans, sastrugi, dunes, pits, etc.) formed on a snow field, as a wind redistributes a surface layer of deposited snow. Profiles of wind speed were obtained from measurements in the lower surface layer, where snow drifts over dry snow and bare ice surfaces, in Hokkaido, Japan, and in Mizuho Plateau, East Antarctica. A chilecodal stream argund an obstruction (two small huts) was observed by trajectories of smoke and drifting snow particles. When a wind stream encountered an obstacle or a surface irregularity, its boundary layer was separated and turbulent waves were formed around it. Deposition and crosion are discussed in connection with local eddy patterns. (Auth. mod.)

Sorted stripes found on the volcanic scoria and glacial deposits Sorted stripes found on the volcanic scoria and glacial deposits of Subantarctic Marion Island indicate a distinct preferred orientation. Despite uniformity of slope and material, the stripes are predominantly aligned parallel to the wind. It is suggested that melting of needle ice by the early morning sun is of only limited importance in the Subantarctic, owing to the almost continual overcast conditions. The effect of the wind is so great that in exposed situations stripes are formed on horizontal sufaces. (Auth.)

States—Alaska—Susitna River.

The primary objectives of this study were to 1) prepare a map from Landsat imagery of the Upper Susitna River Basin drainage network, lakes, glaciers and snowfields, 2) identify possible faults and lineaments within the upper basin and within a 100-km radius of the proposed Devil Canyon and Watana dam sites as observed on Landsat imagery, and 3) prepare a Landsaterived map showing the distribution of surficial geologic materials and poorly drained areas. The EROS Digital Image Enhancement System (EDIES) provided computer-enhanced images of Landsat-1 scene 5470-19560. The EDIES false color composite of this scene was used as the base for mapping drainage network, lakes, glaciers and snowfields, six surficial geologic materials units and poorly drained areas. Some single-band and other color composites of Landsat images were geologic materials units and poorly drained areas. Some single-band and other color composites of Landsat images were used Juring interpretation. All the above maps were prepared by photointerpretation of Landsat images without using computer analysis, aerial photographs, field data, or published reports

thickness, Ice friction, Ice strength.

This report presents the results of the tests on the new U.S. Coast Guard 140-ft icebreaker Katmai Bay (WTGB-101) in the level plate ice and brash ice in Whitefish Bay and the St. Marys. River. The results indicate that the vessel can penentrate 22 in. of level freshwater ice with 2-3 in. of snow cover. It can also penetrate up to 48 in. of brash ice in a continuous mode and at least 30 in. of plate ice by backing and ramming. The installed bubbler system decreased the required power of the vessel from 10 to 30<sup>th</sup> in brash ice and 25 to 35<sup>th</sup> in level ice. The low friction coating appears to be effective in decreasing the friction factor when it remains intact; when it peels off, it appears to make conditions worse than plain paint. An average dynamic friction factor of 0.15 could be used over the entire hull for these tests.

Cuymon, G.L., Johnson, T.C.
Mathematical models, Frost heave, Frost penetration, Heat transfer, Soil water migration, Pavements, Computerized simulation. Laboratory techniques. Forecasting.

A mathematical model of coupled heat and moisture flow in soils has been developed. The model includes algorithms for phase change of soil moisture and frost heave and permits sevphase change of soil moisture and frost neave and permits several types of boundary and initial conditions. The finite element method of weighted residuals (Galerkin procedure) was chosen to simulate the spatial regime, and the Crank-Nicholson method was used for the time domain portion of the model. To facilitate evaluation of the model, the heat and moisture fluxes were essentially decoupled; moisture flux was then simulating the control of the model. fluxes were essentially decoupled; moisture flux was then simulated accurately, as were heat flux and frost heave in a laboratory test. Comparison of the simulated and experimental data illustrates the importance of unsaturated hydraulic conductivity. It is one parameter which is difficult to measure and for which only a few laboratory test results are available. Therefore, unsaturated hydraulic conductivities calculated in the computer model may be a significant source of error in calculations of frost heave. The algorithm incorporating effects of surcharge and overburden was inconclusively evaluated. Time-dependent frost penetration and frost heave in laboratory specimens were closely simulated with the model. After 10 Time-dependent frost penetration and frost heave in laboratory specimens were closely simulated with the model. After 10 days of simulation, the computed frost heave was about 2.3 cm vs. 2.0 cm and 2.8 cm in two tests. Frost penetration was computed as 15 cm and was measured at 12.0 cm and 12.2 cm in the two laboratory samples after 10 days.

Golovkin, B.N., Voprosy introduktsii rastenii na Kol'-skom Severe (Introduction of plants in the northern Kola Peninsula) edited by G.N. Andreev and I. M. Luk'ianova, Apatity, Akademia nauk SSSR, 1979, p.30-41, Russian Refs. p.40-41 Introduced plants, Plant ecology.

Introduced plants, Plant ecology.

Plants of the subpitantic and antarctic areas hold great promise as potential species suitable for introduction in the Far North, since they are able to withstand harsh conditions. Some few one-side introduction studies have been done with such plants, these are reviewed here. Also, subantiactic and antarctic plants have been successfully cultivated in various botanical gardens and research stations in the Soviet Union and elsewhere. This research is also reviewed with the aim of identifying promising directions for future work.

Alexander, M.

Waste disposal, Water treatment. Soil chemistry, Laboratory techniques.

Laboratory techniques.
In laboratory experiments, denitrification of nitrate in wastewater proceeded slowly in an acid soil (pH 4.2), but the rate was last in soils with pH values of 5.5 to 6.8. The rate of denitrification was governed by the carbon source added, with glucose supporting the fastest rate. The rate was somewhat slower with methanol and succinate and was appreciably slower with secondary effluents as the source of supplemental carbon Charlton loam supported the more rapid dentification with glucose as a carbon source, but the rate was higher in Windsor andly loam with sewage as the carbon source. Denitrification in these soils did not occur at 1C, and the rate increased with rising temperatures. rising temperatures

Simplified model for prediction of nitrogen behavior

in land treatment of wastewater.
Selim, H.M., et al, U.S. Army Cold Regions Research and Engineering Laboratory, Apr. 1980, CR 80-12, 49p., ADA-085 191, 23 refs. Iskandar, I.K.

Waste treatment, Water treatment, Nutrient cycle, Soil chemistry, Nitrogen.

Soil chemistry, Nitrogen.

A simplified model for simulation of mitrogen transformations and transportation in land treatment of wastewater is presented. The purpose of the model is to predict the behavior of NH4-N and NO3-N in the soil profile in land treatment systems. The program is based on the solution of the transfort soil water flow equation simultaneously with the equations describing the transformation, transport, and plant uptake of nitrogen in the soil. The program is valid for uniform as well as multilayered soil profiles and can be adapted to incorporate various nitrogen transformation mechanisms and boundary conditions. The model can be used as a tool to predict the fate of nitrogen in land treatment systems. Model sensitivity to changes in the rate of nitrification, ammonium ion exchange, and rate of plant uptake of nitrogen is also described. Description of the computer program, the program listing, and an example of input data and a two-week computer simulation of output data are presented

Wastewater treatment in cold regions by overland

Martel, C.J., et al, U.S. Army, Cold Regions Research and Engineering Laboratory, Feb. 1980, CR 80-7, 14p. ADA-084-489, 16 refs.

Jenkins, T.F., Palazzo, A.J. Waste treatment, Water treatment, Irrigation, Cold. weather performance, Engineering, Soil chemistry, Agriculture.

Agriculture.

Primary effluent, secondary effluent (package extended aeration) plant effluent with BOD's often greater than 30 mg liter) and tarwater were applied to separate sections of a pilot-scale overland flow site in a cold regions environment. The average application rate for each section was 5.0 cm (2.0 m.) per week. Performance was evaluated for one year, May 1977 to June 1978. Results of this study demonstrated that overland flow can renovate both primary and secondary effluent during spring, summer and fall seasons. However, during winter, run-off water quality from the primary section contained almost no pollutants during its entire operation. Ammonia was the easist form of introgen to remove and intrate was the most difficult. Rainstorins did not cause a "flushing" effect. However, ammonia and nitrate concentrations in the runoff increased during snowmelt. The forage yield from the primary and secondary sections was almost twic, that of a typical New Hampshire has field. Wastewater application during winter caused only minor cases of plant injury. Based on these results, a minimum of 30 days of storage is recommended if overland flow is used as a polishing process. If overland flow is used to treat primary effluent, the number of storage days predicted by EPA-1 computer program appears to be adequate.

High-explosive cratering in frozen and unfrozen soils

in Alaska.

Smith. N., U.S. Army Cold Regions Research and Engineering Laboratory, Feb. 1980, CR 80-9, 21p., ADA-084 702, 8 refs.

Frozen ground mechanics, Explosion effects, Seasonal freeze thaw, Taliks, Excavation, Tests.

sonal freeze thaw, Talliks, Excavation, Tests.

Explosive cratering tests were conducted in seasonally frozen and inawed gravel at Ft Richardson near Anchorage, Alaska, and a seasonally frozen and thawed silt overlying permafrost and in silt permafrost at Ft Wainwright near Fairbanks, Alaska Explosive charge weights ranged from 26 to 3120 lb, and charge burial depths ranged from about 3 to 40 ft. The cube root of the charge weight sealing was used to determine maximum scaled crater dimensions and optimum scaled depth of burial of the charge. Test results for frozen and thawed gravel were essentially the same because of the low moisture content and the relatively shallow depth of freezing (5 to 6 ft). The optimum depth of burial of the charge for maximizing the apparent radius and depth and the true radius was about 1.8 times the cube root of the charge weight for both the frozen and thawed conditions, in seasonally frozen silt overlying a talik and silt permafrost, the maximum scaled crater dimensions and optimum scaled burial depths of the charge were smaller than for the thawed condition except for the true crater dimensions. The channeling of energy in the talik produces maximum crater dimensions and an optimum burial depth for the true crater than for the thawed condition. The results for the homogeneous silt permafrost were very similar to the frozen gravel results, with much smaller maximum crater dimensions and smaller optimum charge burial depths than for the thawed silt overlying and the foreign gravel results, with much smaller maximum crater dimensions and smaller optimum charge burial depths than for the thaved silt overlying and the foreign gravel results, with much smaller maximum crater dimensions and smaller optimum charge burial depths than for the thaved silt overlying and the foreign gravel results, with much smaller maximum crater dimensions and smaller optimum charge burial depths than for the thaved silt overlying and the silt of the foreign gravel results. much smaller maximum crater dimensions and smaller op-timum charge burial depths than for the thawed silt overlying

Roof leaks in cold regions: school at Chevak, Alaska. Tobiasson, W., et al. U.S. Arm) Cold Regions Research and Engineering Laboratory, Apr. 1980, CR 80-11, 12p. ADA-084 914.
Johnson, P.R.

Roofs, Leakage, Buildings, Meltwater, Snow accumulation, Condensation, Subpolar regions.

Four types of roof leaks occurred at a new school building in Chevak, Alaska: 1) blowing snow entered the roof through eave vents and then melted, 2) slush and ice in roof valleys caused vents and then melted, 2) slush and ice in roof valleys caused meltwater to overflow the valley flashing and run into the building, 3) water entered at a roof/wall intersection and 4) in many areas water entered through gaps in the sloping plywood deck. Sealing the cave vents made it impossible for blowing snow to enter the roof at the eaves. Electric heat tancs eliminated the valley ucing problem. Missing flashing was responsible for the roof-wall intersection leaks. The absence of a vapor barrier in the roof was the cause of many leaks. It was recommended that the roof be repaired from the exterior by removing component elements down to the plywood deck, installing an adhered continuous vapor barrier and reassembling the roof. An alternative roof cladding of composition shingles was discussed as commous vapor partier and reassembling the roof. An alter-native roof cladding of composition shingles was discussed as was conversion to a "cold roof." The roof was repaired and modified following recommendations, and problems appear to have been solved. have been solved

Documentation for a two-level dynamic thermody-

namic sea ice model. Hibler, W.D., III, U.S. Army Cold Regions Research and Engineering Luboratory, Feb. 1980, SR 80-8, 35p., ADA-084 273, 9 refs

Sea ice, Ice thermal properties, Thermodynamic properties, Heat transfer, Ice mechanics, Ice cover thickness, Mathematical models, Computer programs, Rheology.

A discussion of the numerics and computer code for a two-level dynamic thermodynamic sea ice model is presented. For interested users a listing of the computer code and results from a 21-day test run are included as appendices. To a large degree this report is meant to serve as an extended appendix to an article by the author in the Journal of Physical Oceanography (see 34-741) describing his model and a variety of simulation results. The model consists of a two-level ice thickness distribution coupled to the ice dynamics by a plastic theology. In addition to the ice interaction, the momentum balance includes nonlinear wind and water drag terms. Corrolls force, and inertial and momentum advection terms. The numerical scheme is formulated in an energy-conserving manner in a fixed Eulerian grid which allows simulation over unlimited time intervals. The momentum balance (including inertial terms) is numerically treated in a semi-implicit manner so that time steps of up A discussion of the numerics and computer code for a two-level cally treated in a semi-implicit manner so that time steps of up to one day in length may be used if desired. The boundaries, grid size and time step magnitude are easily modified so that the model should have application to a variety of climate an 'forecasting problems

Ice thickness-tensile stress relationship for load-bearing ice.

Johnson, P.R., U.S. Army Cold Regions Research and Engineering Laboratory, Feb. 1980, SR 80-9, 11p. ADA-084 274, 3 refs.

Ice cover strength, Ice loads, Ice crossings, Ice roads,

Ice cover strength, Ice loads, Ice crossings, Ice roads, Tensile properties, Stresses, Ice cover thickness. The "bearing capacity" of a floating ice sheet is of considerable interest. The pattern of ice thickness vs tensile stress for a fixed load and fixed ice properties was examined and showed some constant relationships. It proved possible to completely describe the ice thickness-tensile stress pattern in terms of a single number. When the load was changed by increasing the payload but not altering the geometry of the load pattern, other relationships were found that described the tensile stress in the ice sheet for any combination of payload and ice thickness. This provides a simple method of finding tensile stress in the ice that can be used in the field. Further studies are planned

Operation of the CRREL prototype air transportable

Flanders, S.N., L.S. Army Cold Regions Research and Engineering Laboratory, Feb. 1980, SR 80-10, 73p. ADA-084 275. Portable shelters, Cold weather performance, Trans-

portation, Airplanes, Logistics.

portation, Airplanes, Logistics. This report describes the operation of the CRREL prototype air-transportable shelter which was designed specifically for use in cold regions. The operating instructions cover moving the shelter on its own wheels or skis, loading it onto a truck or military transport aircraft slinging it from a helicopter or preparing it for shipment as an ISO container. The report details how to site the shelter and expand it to about double its transport size. The report also covers operation of the utility systems, including the on-board alternator set, the primary and auxiliary heating systems, the water system, and various safety systems. systems

Snow fortifications as protection against shaped

Snow strength, Fortifications, Cold weather construction, Cold weather operation, Snow (construction material), Explosion effects, Impact tests, Detonation waves, Embankments.

tion waves, Embankments.

This report chronicles an investigation of the effectiveness of snow fortifications. The test was planned to observe and measure how packed snow absorbs the energy of high explosive antitiank (HEAT) ammunition. In the test plan both the possibility of non-detonation due to insufficient resistance in snow and the rate of deterioration of a snow embankment with repeated impacts were considered. The 90-mm Mo7 recoiless reflexives used because it has a relatively leave about some disease. pearen impacts were considered. In evi-mit Mol recoilles, rife was used because it has a relatively low velocity, and its charge was more likely to not detonate than that of a high velocity weapon. The findings indicate that snow can be used to good advantage for building expedient fortifications, particulately in retinations. larly in situations where large volumes of snow have to be cleared from roads and airfields

Extending the useful life of DYE-2 to 1986. Part 2:

1979 findings and final recommendations.

Tobiasson, W., et al. U.S. Army Cold Regions Re-80-13, 37p., ADA-084 278, 8 refs. Tilton, P

Radar, Stations, Snow accumulation, Ice formation, Snow strength, Loads (forces), Steel structures, Stresses, Cost analysis.

Stresses, Cost analysis.

A major construction effort is needed at Dew Line Ice Cap Station DY E-2 to extend its useful life to 1986. That work should be done as soon as possible because the truss enclosure is deteriorating rapidly. Although a 210-ft sideways move as was accomplished at DYE-3 in 1977 is technically feasible, the alternative of backfilling the truss enclosure with ice is expected to cost about \$2.7 million less. Unless there is a strong possibility that DY E-2 will be needed for many years beyond 1986, the ice backfill alternative is recommended.

54-5353 CRREL roof moisture survey, Pease AFB buildings 35, 63, 93, 112, 113, 120 and 220. Korhonen, C., et al, U.S. Army Cold Regions Research and Engineering Laboratory, Mar. 1980, SR 80-14 31p., ADA-084 279, 3 refs.

Roofs, Moisture transfer, Detection, Infrared spec-

ments.

We surveyed the roofs of seven buildings at Pease AFB with a hand-held infrared scanner to detect wet insulation. We used white spray paint to outline the wet areas and took core samples of the built-up membrane and insulation to verify our findings. Flashing defects around penetrations and bordering walls appear to be the major cause of the wet insulation found on these roofs. Since most problem areas are localized, we directed our repair recommendations toward salvaging as much of each roof as is economically possible.

Antarctic navigation.
Woodfield, T., Journal of navigation, May 1979, 32(2), p.234-242, Includes discussion.
Ice navigation, Sea ice, Weather observations.

Ice navigation, Sea ice, Weather observations. The author shares some of the wisdom he has gained from nineteen years as master of survey ships supporting the BAS in its antarctic research programs. He describes the treacherous weather conditions of the Southern Ocean, the order in which sea ice forms are encountered during a southbound voyage, and suggests good seamanship practices for safely maneuvering a vessel in pack ice. He tells how to read weather indicators, recommends navigation methods, and cautions against the pitfalls inherent in the use of either magnetic or gyro compasses. With less than one percent of antarctic waters properly suveyed, he stresses that progress when off charted routes must be slow, careful, and vigilant.

Patrick, W.H., Jr. Waste treatment, Water treatment, Nutrient cycle, Soil chemistry.

Soil chemistry.

Treating wastewater in properly designed and operated overland flow systems results in significant amounts of N being removed through nitrification-dentification-reactions. Application of wastewater containing NH4-N in a simulated overland flow model led to the disappearance of ammonium and the formation of nitrate in oxidized surface soil. The N balance in the simulated overland flow system was estimated by using labeled 15. N. The amount of N removed in the system depends upon denitrification rates. The results of this study indicated that N adsorption on the soil complex and uptake of applied ammonium by vegetation accounted for the N removed in the overland flow systems. The adsorbed ammonium on the aerated surface soil mass was nitrified and converted to oxidized forms of N. The nitrate thus formed diffused downward to the reduced zone during subsequent wastewater applications. Some of this nitrate then denitrified and converted to gaseous form of N or was assimilated and reduced by plant life. Results of the overland flow studies indicated that approximately 55-68" of wastewater NH4-N added to the simulated overland flow system was unaccounted for in controlled laboratory environments. This NH4-N was presumably returned to the atmosphere

Environmental protection, Antarctica.

This report investigates the technical and economic feasibility of a satellite-based polar environmental monitoring system. User benefits to industry, government and the scientific community are discussed and interested and active user groups identified. The report is then organized into the following sections user needs for polar environmental information; pections user needs for polar environmental information; but measurement status, sensor status; trajectory tradeoffs; data processing and delivery alternatives, platform (payload) alternatives; and sample implementation alternatives for polar research.

Study of shorelines in the building and operation of Siberian reservoirs.

Vendrov, S.L., et al, U.S. Army Cold Regions Research and Engineering Laboratory, Feb. 1980, TL 724, 10p., ADB-046 835L, For Russian original see 32-439. 22 refs. Shirokov, V.M.

Shoreline modification, Reservoirs, Shore erosion, Permafrost beneath lakes, Ground ice, Forecasting, Water storage.

Water storage.

Since the early 1950's, increased construction of large reservoirs has led to expanded studies of shoreline re-formation. Shorelines of reservoirs have been studied in two stages: 1) during the construction period and filling of the reservoir and 2) during its long-term use. Forecasting of shoreline changes not only for reservoir design but also for long-term use of the shores has attained importance. Problems needing study currently include improvement of long-term forecasts and checking of their accuracy, large scale study of shoreline re-formation throughout the country, studies of the shorelines of small and medium-sized Siberian reservoirs, changes in water level, linked reservoirs, genetic classification of reservoir shorelines, and study of the development of shorelines of reservoirs along the Baykal-Amur railroad.

The distribution of permafrost in the vicinity of the Boguchansk The distribution of permaftost in the vicinity of the Boguchans. Reservoir is irregular. It covers 20:40% of the region generally on shaded north-facing slopes, in deep ravines and small valleys, and in populated areas. The top of the permaftost is mainly at 0.5 to 2.5 m depth, thickness is generally 5-10 m and can reach 20 m. The depth of seasonal freezing of soils varies greatly, depending mainly on the amount of snow cover and type of soil (range 0.6-3.5 m). Disruption of natural conditions (cutting of forests, fires, plowing, road-building) will cause rapid degradation of the permaftost. Construction of the reservoir will lead to drampatic change (permaftost degradation) in the shorehie zone. shoroline zone

tion, Earthquakes, USSR—Angara River.

A string of hydroelectric dams in Eastern Siberia have created a system of reservoirs some 800-900 km long. The reservoirs have created a host of hydrological and geological problems, including eroding banks, activated karsting, mudslides, landslides, increases in the height of the water table, and changes in the processes of ground water-surface water exchange. The Soviet Institute of the Earth's Crust has been studying these problems. They have published a number of reports, modeled various processes, and developed a program for future research

Thermal behavior of concrete slab on frozen ground bed.

Forest tundra, Ecology, Biogeography, Vegetation,

Climate, Animals, Soils.

A description is given of the basic components of biogeocenoses of the territory of the "Snow Valley" station, situated by the Okhotsk Sea land province: the geological structure, the topography, soil-forming rocks, the climate, the vegetation and soil beds, the flora of vascular plants, fungi and mosses, entomcfauna and fauna of land invertebrates, the morphological servetic characteristics and the hydrothermal resulation of the genetic characteristics, and the hydrothermal regulation of the more prevalent soils of the station. Diagrams of the vegetation and soil covers are given also. The str cture of the soil cover is separated into various grades in the soil diagram. Much at-tention has been devoted to human activity in the soil and vegetation covers.

Shoreline modification, Geocryology, Slope processes, Frost weathering, Permafrost beneath structures, Hydraulic structures, Earthquakes, USSR— Baykal Lake.

A 20-km length of the northern shoreline of Lake Baikal was investigated in connection with construction of the Baykal-Amur railroad. Interaction of the water body with the shore and geological evolution of the shoreline were studied. Morphology of the shore and bottom is described. Natural reworking of the shoreline and the effects and consequences of human activities (construction) are discussed.

Studying the effect of water reservoirs on slope pro-

cesses on their shores. Kachugin, E.G., U.S. Army Cold Regions Research and Engineering Laboratory, Mar. 1980, TL 732, 3p., ADB-047 447L, For Russian original see 25-1305. Slope processes, Slope stability, Shore erosion,

Reservoirs.

This is a general description of reservoir shore erosion processes and data needs to assess slope stability, soil mechanics and landslide dynamics. The characteristics and types of landslides typical of the reservoir shores along the Volga are described. The following factors contribute to the loss of shore stability along these shores: abrasion at the waterline; gully and rill erosion along the face of the slope; ground water saturation of slope material and groundwater piping; chemical weathering and erosion of slope material; rapid pool level fluctuations causing alternating wetting and drying of slope and increase of hydrostatic pressure in slope after rapid drop in water level; and man-induced effects. Quantitative information on shore erosion and landslide processes is needed to predict reservoir shoreline recession.

Recent geological processes and phenomena observed

on the southern shore of Ob' Bay.
Trepetsov, E.V., U.S. Army Cold Regions Research and Engineering Laboratory, Mar. 1980, TL 733, 4p., ADB-046 841L, For Russian original see 29-2169.

Slope processes, Permafrost structure, Permafrost

Slope processes, Permafrost structure, Permafrost weathering, Thermokarst, Environmental impact, Geomorphology, Clays, Sands, USSR—Ob' Bay. Parts of the shorelines of Ob' Bay and Tasov' Bay were studied in connection with planned and current construction projects in the Tumen' district. Windward shores composed of frozen loams, sands and sandy loams are retreating at a rate of about 0.9 m/yr due to abrasion, snow erosion and solifluction. Destruction of the turf cover by man has led to development of scours, ravines and gorges; in sand and sandy loam permafrost the rate of development is 48 m/yr. During summer, small streams fed by meltwater from thawing saturated permafrost exist in ravines. Also observed were thermokarst pits and lakes and frost mounds up to 5 m high.

How to compute complex interconnected district

heating systems. Wehr, R., et al, U.S. Army Cold Regions Research and Engineering Laboratory, Mar. 1980, Tl. 734, 13p., ADA-084 211, Translated from Fernwärme international, 1979, 8(5):247-252. 6 refs.

Tautz. A.

Heating, Heat transmission, Computer programs, District heating.

The cost-intensive extension of urban district heating systems The cost-intensive extension of urban district heating systems demands a relatively accurate assessment of the distribution apparatus with respect to the heating market to be supplied. Here we consider the plans of currently available computer programs which can reproduce with practical approximation the operating conditions of complicated interconnected heating networks. Along with the validity of the program, the quality of its application is equally critical; this application requires a meticulous analysis of parameters such as line resistances, temperature conditions and load distribution.

Differences between explosions and earthquakes. Cheng, Z.C., et al, U.S. Army Cold Regions Research and Engineering Laboratory, Mar. 1980, TL 735, 18p., ADA-084 245, Translated from Acta Geophysica Sinica, July 1975, 18(3):208-216. 11 refs.

This book examines the characteristics of foundation design on ground ice and ice-neh permafrost soils which are common in the Far North. The characteristics of these foundations are de-termined primarily by the properties of the enclosed or ground ice; therefore the latter is emphasized in this book. Based on experimental research, the authors establish patterns of deforexperimental research, the authors establish patterns of defor-mation of ice-rich ground and ground ice under load, cite recommendations for the determination of characteristics necessary for design, present methods of computing foundation settling caused by the viscous flow of ice and ice-rich ground, and indicate methods of their application to engineering using examples Supplementary tables and graphs contained in the book contribute to its value.

Pipelines, Transmission lines, Hydraulic structures. Damage, Engineering, Excavation, Sea ice, Subsea

Damage, Engineering, Excavation, Sea ice, Subsea permafrost, Ice scoring, Polar regions.

Special environmental factors that influence the design, laying and maintenance of undersea pipelines and cables in polar waters are described. Various approaches to the protection of submarine pipes and cables are considered, and prime emphasis given to burial techniques for shallow water. A wide range of methods for trenching and burying are discussed, and technical, that are meen. cal data are given

ment, Waste disposal.

The performance of the six land treatment cells is summarized over a five-year period from June 1937 through May 1978. The data presented inclind, quality and volume of wastewater applied and percolate resulting from application of primary and secondary wastewater by spray irrigation. Mass loadings and removals are presented as well as crop production and nutrient uptake. Nutrient balance sheets are shown which demonstrate the percentage of nitrogen and phosphorus that is attributed to crop uptake and leachate over this period.

34.3450

Influence of nose shape and L/D ratio on projectile

Richmond, P.W., U.S. Army Cold Regions Research and Engineering Laboratory, Apr. 1980, SR 80-17, 21p., ADA-085 398, 10 refs.
Frozen ground, Projectile penetration, Solutions, Ex-

perimentation.

perimentation. This report presents the results of a laboratory test program designed to determine the applicability of two analytical solutions to projectile penetrations in frozen soils. The test program consisted of firing small calible reylindrical projectiles into frozen soil targets. Four types of 7.9-mm-diam projectiles were tested, two with a hemispherical nose the other two flatnosed, with both long (length/diameter = 40 and short (L/D=2) versions of each nose shape. Penetration depth versus impact velocity data are presented. Comparisons of the data indicate that a flat-nosed projectile is a less efficient penetrator than one of equal weight with a hemispherical nose. A small increase in resistance to penetration is observed for an increased L/D ratio.

Helicopters, Tests.

Screening tests to select teephobic coatings displaying low ice release forces, both before and after exposure to rain crossion in a whirling arm simulator, were performed on approximately 60 commercial materials. A unique linear ball-slide shear test apparatus was designed to provide pure shear forces. No coating strivived the crosson test to give an interfacial shear strength as low as 15 psi (103 kPa), an arbitrarily established goal. Several coatings showed shear strengths between 30 and 45 psi (207 and 310 kPa) after rain crosson.

USCGC Glacier cruise report: Deep Freeze 80. U.S. Coast Guard, Long Beach, Cal., Mar. 1980, 106p. Ice breaking, Ships, Logistics, Ice navigation, Antarctica.

tica.

The scientific mission during this deployment was primarily a marine geologic survey of the antarctic continental margin from 163W to Cape Adare southward to McMurdo. An extensive survey of McMurdo Sound was included \*\*Glacier's primary objectice was to obtain data from those areas never before surveyed in order to connect with data obtained from previous cruises. The operational and logistics mission, in direct support of the resupply of McMurdo, consisted of excort service for the resupply vessels, facing the ice wharf, and towing out the ice wharf upon completion of the offloads.

Computer mapping, based on the Landsat digital data, can aid the efficient management of one of New Zealand's resources the annual snowpack. The same techniques are effective in supporting antarctic cartography, glaciology, and surface operations. The development of digital analysis and enhancement techniques for the routine semi-automated evaluation of Land-sat data is illustrated. The 1979 field program will concentrate on an instrumented snow basin for a water yield study. An outline of this satellite ground program is presented. (Auth.)

Ice core and ice cement effects on soil development,

eastern Wright Valley, Antarctica.

Bockheim, J.G., New Zealand journal of geology and geophysics, 19/9, 22(4), p.487-493, 20 refs.

Ground ice, Soil formation, Antarctica—Wright Val-

formation on hummocky drift behind Trilogy. Loop, and C end moraines in eastern Wright Valley. Soils on the Trilogy and Loop hummocks contain fewer salts and are coarser in texture than soils on the associated end moraines. Lack of soil development on hummocks is due to frost heaving and sorting, and while soils on hummocks behind the Loop end moraine may be as old as c. 135,000 y. B.P., they have properties more closely resembling the 18,000-year-old Trilogy soils. Data suggest that soil chromosequences may be invalid where component soils have been disturbed by frost action, and that soils on comparable sites must be used for comparative weathering studies. 34-3624 International Workshop on the Seasonal Sea Ice Zone, Monterey, California, Feb. 26-Mar.1, 1979. Andersen, B.G., ed, Cold regions science and technology, Apr. 1980, Vol.2, MP 1292, 357p., For individual papers see 34-3625 through 34-3632 or B-23446, F-23442 through F-23445, and F-23447. Weeks, W.F., ed, Newton, J.L., ed.

Meetings, Sea ice. Pack ice. Ice pileup, Acoustics, Climatology, Ecology, Oceanography.

This volume comprises a series of state-of-the ort papers by individual authors, followed by disciplinary panel statements offering research suggestions and identifying particular problems with the discipline under consideration. Several interdisciplinary panel reports are included air-sea-ice interactions, biological interactions, engineering interactions, and acoustic

34-3625

Overview (International Workshop on the Seasonal Sea Ice Zonej. Weeks, W.F., Cold regions science and technology, Apr. 1980, Vol.2, MP 1293, p.1-35, 2 refs.

Sea ice distribution, Seasonal variations, Meetings, Models, Air water interactions, Ice water interface, Meteorology, Engineering, Oceanography, Offshore drilling.

This overview is an attempt to summarize the principal conclu sions that can be drawn from the workshop. The article is divided into three sections: disciplinary studies (ice, oceanography, meteorology and climatology, biological regimes, hydroacoustics, coastal processes), interdisciplinary studies; and engineering aspects of offshore resource exploration in the polar regions. Modeling of a wide variety of processes is discussed. 34-3626

Ice characteristics in the seasonal sea ice zone.

Wadhams, P., Cold regions science and technology, Apr. 1980, Vol.2, p.37-92, Refs. p.81-87. Includes disciplinary panel statement, p.90-92.
Fast ice, Wave propagation, Ice breakup, Shear prop-

erties, Models, Frazil ice, Young ice. Although the bulk of this article is devoted to north polar ice, antarctic sea ice is discussed briefly, primarily to point out the

great scarcity of facts known about it and to stress the entities different nature of antarctic sea ace from arotic.

34-3627

Physical oceanography of the seasonal sea ice zone. Physical oceanography of the seasonal sea ice zone. McPhee, M.G., Cold regions science and technology. Apr. 1980, Vol.2, MP 1294, p.93-132, Refs p.116-118 Includes disciplinary panel statement, p.119-132. Polynyas, Oceanography, Sea ice, Ice water interface, Seasonal variations, Salinity, Ice edge.

This literature review is divided into four parts. The first deals with the role of continental shelves at the margins of polar oceans in maintaining water masses, the second emphasizes how the ocean might affect the advance and retreat of ice not contained by land, the third describes some special conditions found in the shear zone, and the fourth is a brief look at experimental techniques and instruments

14.1678

Meteorology and climatology of the seasonal sea ice

Barry, R.G., Cold regions science and technology, Apr. 1980, Vol.2, p.133-156, Refs. p.147-150,156.

Includes disciplinary panel statement. Se ice, Pack ice, Seasonal variations, Atmospheric circulation, Polynyas, Meteorology, Climatic factors, tce . r interface.

him has seasonal sea fee zone is defined by the seasonal range of it. Imits, its meteorological characterization is not readily destribed in a systematic manner. Moreover, the ice limits are des abed in a systematic manner. Moreover, the ice limits are not solely determined by meteorological factors, nor does the SSIZ set up a unique chinatological regime. zone. Hibler, W.D., III, Cold regions science and technology, Apr. 1980, Vol.2, MP 1296, p.299-356, Refs. p.317-320. Includes disciplinary panel statement. Sea ice, Seasonal variations, Computerized simulation, Ice models, Mathematical models.

Various approaches to modelling sea use have been tried by investigators; the author discusses the suitability of different types of simulations for particular research goals. Empirical studies are also reviewed. Literature covered relates to see in both arctic and antarctic regions.

34-3633

Polar atmosphere-ice-ocean processes: a review of polar problems in climate research.

Polar Group, Reviews of geophysics and space physics, May 1980, 18(2), p.525-543, Refs. p.540-543. Baker, D.J., Radok, U., Weller, G Research projects, Climatology, Oceanography, Sea

ice, Ice air interface, Air water interactions, Models. Ice, Ice air interface, Air water interactions, Models. Interactions of the atmosphere, ice, and the oceans in the polar regions are reviewed in the context of global climate. Cryospheric processes and their feedback mechanisms are discussed, with emphasis on sea ice, the polar energy balance, meridional heat exchange processes in both the atmosphere and the ocean, and the paleoclimatic record stored in ice sheets and snow Present modeling capabilities and parameterizations of polar ice, atmosphere, and ocean processes and their interactions are described. Further advances in our understanding of polar processes call for studies of ice dynamics and of energy transfers by radiation, convection, and advection, in both atmosphere radiation, convection, and advection, in both atmosphere d ocean. The relationship of the energy transfers to mesosand ocean

The Later Street Command 12

cale and large-scale circulation features, to the moving pack ice. cate and large-scale circulation features, to the moving pack ice boundaries, and to the annual growth and decay of ice in both hemispheres affects the energy balance and circulation and is a key factor in the global climate system. Further progress will demand systematic monitoring of climate processes in both polar regions, using an increasingly sophisticated satellite technology for the establishment of a polar climate data set (Auth.)

Equipment.

The development of a rotary snowplow designed to remove 3000 tons hour of snow at a speed of 20 km/hr is described. The four-wheel-drive vehicle was designed for use in areas of Hokkaido where snow accumulation and drifting are a major problem. It is powered by a 700-hp diesel engine and weighs about 22,000 kg. The snow removal equipment consists of a two-stage blower with cone ribbon serew type auger. The device has been tested in heavy snow conditions with snowslides and drifting, with excellent results and only minor mechanical problems.

DLC GR2403.2 D95 Ice sheets, Ice shelves, Glaciers, Sea ice, Icebergs.

Ice sheets, Ice shelves, Glaciers, Sea ice, Icebergs. This book review the dynamical aspects of snow and ice masses on the geophysical scale. It is divided into seven chapters, each of which describes the basic features of a particular snow or ice mass. In each chapter a conceptual fraint-work is established on a physical basis, and a mathematical description is provided with as many references to the technical literature as space allows. No attempt is made to address particular applications of the information, but the physical and mathematical descriptions of the properties and processes provide for both an understanding of snow and ice masses and a basis through which particular problems can be addressed.

Ice sheets and ice shelves.

Petrographic observation, of ice samples from Taylor Glacier, Antarctica.

Robinson, P.H., New Zealand antarctic record, 1979, 2(1), p.17-19, 2 refs. Glacier ice, Stratification, Rocks, Regelation, Antarc-

tica-Taylor Glacier.

tica—Taylor Glacier.

There are basically two petrographically-defined zones in the fee of Taylor Glacier. (1) the dominant, debris-free, weakly foliated, very fine to fine-grained bubbly ice, and 2) the suboidinate, restricted englacial and basal debris-bearing, strongly-foliated, fine to medium-grained, alternating bubbly and clear ice. The bubbly ice zone gains its str. time from "normal" primary stratification of the snow and firm in the accumulation areas and subsequent modification by densification and flow. The origin of the alternating bubble and clear ice layers is rather more complex. Possibilities include. 1) melting by frictional drag along faults subparallel to the glacier bed, where tabbles escaping from this melted layer float upwards and are subsequently refrozen, leaving behind, lear ice and 2) bubble layering in cold glacier ce was considered to result from a redistribution of bubbles during flow along primary stratification planes. Regelation by englacial fractional drag may be a likely mode of commation of clear, debris-free ice layers of Taylor glacier. However, it does not explain the debris-rich alternating bubbly and clear ice layers to Taylor glacier. probable origin for such zones is pressure melting and regulation at the glacter sole — (Auth mod.)

Saline discharge at the snout of Taylor Glacier, An-

tarctica. Ke's, J.R., New Zealand antarctic record, 1979, 2(1), 20-21, 6 refs.

Glacier melting, Glacial hydrology, Meltwater, Salt water, Salinity, Antarctica—Taylor Glacier.

water, Salinity, Antarctica—Taylor Glacier.
At intervals of one to a few years, during the "non summer"
months, some thousands of cubic metres of sality water flows out
from either a crevasse at the northern corner of the snout of
fasylor Glacier, or a source beside the glacier near this crevasse.
This fluid freezes to form an outwash fan (cone), or platform,
of saline ice on the debris-covered mound and delta beside the
glacier. The saline ice fan is usually various shades of orange
in colour, due to small amounts of hydrated iron oxides and silt
in the summers and varis between such discharge events, the in colour, due to small amounts of hydrated fron oxides and silt in the summers and years between such discharge events, the ice fan ablates until there is no saline ice remaining on the mound or delta. However, salty orange englacial layers, present throughout the history of each individual discharge event, remain around the discharge site in the glacier. It is believed that these layers represent crevasses that were flooded with salty water, which then froze, during past discharge events. Field investigations were carried out in Oct. 1978 and Jan. 1979 and a simple model for the discharge was drawn up. (Auth. mod.) mod )

Eastward ice advances in Wright Valley, Antarctica (Comment).

Robinson, P.H., New Zealand antarctic record, 1979, 2(1), p.22-24, 7 refs. Includes reply by G.G.C. Claridge and I.B. Campbell.

Glacier flow, Antarctica-Wright Valley.

The author postulates a small, hitherto undescribed granite outcrop to the east of the "Aright Upper Glacer as the provenance of granite erratics described by Claridge and Campbell (1978), who reply in rebuttal of the hypothesis

### 34-3677

Hardness of ice and a solar ice melter. Robinson, W.H., et al, New Zealand antaretic record, 1979, 2(2), p.4-8, 4 refs Bibby, B., Tucker, A., Haskell, T., Rodgers, T. Ice hardness, Sea ice, Solar radiation, Equipment, Ice

A simple rig for measuring the displacement of a 6.35 min diameter steel ball into ice under load (10 to 30 N) was developed in the laboratory and used on the ice at Taylor Gla ier tincar. Finger Mour am at the snouth and on the sea ice in McMardo Sooid. As expected the deepth of indentation, h, into the ice varied with time, i. When the results were analyzed to produce a stress-strain rate carse, they were lound to be in gional agreement, with the dislocation moved of creep, where the strain rate is proportional to applied stress. Another project was the testing of a solar collector designed to melt show orice. Over a 6-hou, period (1000 to 1600 hrs. 22 Nov. 1978), the 0.5 sq meter collector produced 3.1. 2 hitres of water from snow, with the surrounding air temperature at -7 to -15C (Auth, mod.). A sample rig for measuring the displacement of a 6.35 mm

Impact of "extreme" events on the Dry Valleys area. Chinn, T.J.H., New Zealand antarctic record, 1979, 2(2), p.9-13, 3 jets.

Glacial hydrology, Glacier melting, Micro-climatology, Antarctica—Wright Valley, Antarctica—Vanda, Lake, Antarctica—Onyx River. Glacial hydrology,

— Vanda, Lake, Antarctica—Onyx River. Because the Dry Valleys of Antarctica are climatically sensitive custronments where the effects of rare extreme events may create substantial and endual. Leatures, the glaciology hydrology research group reports here two such events and their immediate effects. "heat waves" (temperatures five degrees above normal during Lanuary), an unusually heavy snowfall, and an unexplained heavy flow in the Onyx River.

### 34-3679

Concreting in Antarctica.

Varcoe, G.E., New Zealand antarctic record, 1979, 2(2), p. 14-15, 1-ref.

Concrete aggregates, Construction materials, cretes, Concrete strength, Antarctica-Ross Island.

cretes, Concrete strength, Antarctica—Ross Island. This note summarizes the results of concreting in Antarctica, using local aggregate and simple techniques. During the 1977-78 season (Varcoe 1978) various mixtures made with local aggregates were tested in order to determine strength and workability of mix. The aggregate selected as a result of these tests was no longer available in 1979-80, and the only aggregate available lacked "fines". Despite sub-zero temperatures and poor quality of local aggregate (generally vesicular volcanic scoria and vesicular toff) satisfactory open-air concreting, using only very simple techniques, is possible at Ross Island. If accurate and predictable control of mix is required, a screen and crusher must be used to control quality of aggregate. (Auth mod.) mod )

Undulations on the McMurdo Ice Shelf near Scott

Base, Antarctica.
Holdsworth, G., et al. New Zealand antarctic record, 1979, 2(2), p 16-22, 17 refs.
Heine, A.J

Surface roughness, Surface properties, Ice shelves, Stresses, Ice deformation, Plastic deformation, Ice density, Ice models, Antarctica--McMurdo Sound.

density, Ice models, Antarctica—McMurdo Sound. Near Scott Base, a restricted area of the McMurdo Ice Shelf shows prominent surface undulations. The deformation is evidently caused by compressive forces which are transmitted horizontally through the ice shelf as it flows obliquely into the coastline northeast of Pram Point. The ice is assumed to be everywhere free of the sea bed, and the deformation begins as the horizontal compressive stress reaches a critical value to initiate an instability. Some boreholes data are presented together with some surface strain rates in an attempt to quantify the deformation. In order to do this successfully, we conclude that more observations are necessary. (Auth.) that more observations are necessary (Auth.)

Metallurgical examination of some ice screws. Redfern, R.M., New Zealand antarctic record, 1979, 2(2), p.23-29, 4 refs.

Low temperature tests, Metals, Mechanical tests.

Low temperature tests, Metals, Mechanical tests. "Salewa" ice screws and pitons have been manufactured from both medium and low carbon steels. The former mat-rial has a tensile strength of the order of 800 MPa and is likely to give rise to brithe failures at low temperatures, while the latter has a lower strength of the order of 540 MPa, but is not likely to fail in a brittle manner at low temperatures unless strain-aged. The "Choumard" ice screw was made from a heat-treated high strength alloy of the order of 1230 MPa and is unfikely to give rise to brittle failure at low temperatures. The "Inter-Alp" ice screw examined was made from the lowest strength material (of the order of 300 MPa) of the samples, yet poor metallurgical practice has also given rise to doubts concerning its ductile 'brittle behavior at low temperatures. (Auth.)

Drilling through the Lazarev Shelt Glacier started in 1974 for Drilling through the Lazarev Shelf Ofacter Started in 19 4 for studying temperature variations in boreholes and underlying water and obtaining sex states at bottom sedimers varieties. In 1977, the testing site for a new thermal drill was selected from radar sounding data. An area of about 1000 in ice thick-ness, located on the Antarctic Ice Sheet slope 40 km south of bottom, developing drilling technique, measuring ice temperature in marginal parts of the ice, and obtaining isotope analyses of ice cores. In 1978 the bottom was reached at 808 m, good core was obtained, and bottom temperature measured as 7 3C. Borehole inchrometric measurements showed ice velocity growing with depth to 600 m with subsequent decrease. The process and drilling technique are discussed.

Some promising trends in ice mechanics. Assur, A., MP 1300, Symposium on Physics and Mechanics of Ice, Copenhagen, Aug. 6-10, 1979. Proceedings. Edited by P. Tryde, Berlin, Springer-Verlag, 1980, p.1-15, 12 refs.

Ice mechanics, Ice creep, Ice sleets, Stresses, Loads (forces), Ice models, Rheology, Ice cover thickness, Sea ice, Analysis (mathematics).

Sea ice, Analysis (mathematics). Ice sheets are inhomogeneous; properties vary strongly with depth. Theoretical treatment of plates with properties varying perpendicular to the plate has now been satisfactorily developed for floating ice sheets. However, other problems are still waiting for solutions. The use of model ice is developing rapidly Some suggestions of how to analyze such ice are made. Breakthrough-loads on ice sheets diminish with duration of loading, but no satisfactory solution is available based upon classical procedures of applied mechanics.

The discovery of offshore oil in ice-infested waters has caused The discovery of offshore oil in ice-infested waters has caused maje: concern to the design engineers. Some of the problems associated with offshore structures are ice forces, icing, and pile-up. Laboratory facilities have and will continue to solve many of the ice problems. The ice problem at navigation locks, for example, has been solved primarily due to laboratory studies. Also, the results of ice forces due to ice uplift have been virtually eliminated by controlled studies. Laboratories are becoming larger and more sophisticated. This should result in an increase in laboratory studies and a decrease in field studies. Solutions will come faster because conditions can be precisely controlled.

Study of the thermal structure of the antarctic ice cap. Burdecki, F., Notos, 1967, 16(1/4), p.47-69, Refs. p.67-69.

Ice thermal properties, Ice sheets, Ice temperature, Heat sinks, Fleat transfer.

An attempt is made to elaborate a model of the thermal structure of the antarctic cap frock plus ice). The model is based on results of seismic investigations and charts of ice surface temperatures. Taking into consideration the terrestrial heat conduction, the improbability of an extremely low heat condition (negative stored heat) in Antarctica, mad the present distribution of surface temperatures, a "key- imperature" of -10C at sea level at the South Pole is assumed. From temperature cross-sections along 40 meridians, with due consideration to the specific heat of rock and ice, a mean temperature of -24.6C for the whole antarctic cap was derived, that for West Antarctica being -17.7C and for East Antarctica -25.5C. It is found that fother factors which contribute to the growth or decrease of the antarctic ice are in exact equilibrium, an influx of terrestrial heat from below would need a minimum of 368,000 years to annihilate the antarctic ice mass. It is inferred that in the present state the ice amount is not far from its physical maximum. Probably the ice cover of East Antarctica is shrinking slightly at present, whereas the west antarctic ice masses are growing in spite of some regional exceptions. (Auth. mod.) An attempt is made to elaborate a model of the thermal struc-

ness, Antarctica—Erebus Glacier.

L'sing expressions for ice-shelf creep derived by Weertman and Thomas, a general method is developed for calculating equilibrium thickness profiles, velocities, and strain-rates for any ice shelf. This is done first for an unconfined glacier tongue, and her result agrees well with data for Erebus Glacier tongue, Holdsworth, 1974). Anomalies occu, within the first 3 km after the hinge zone, and these are too great to be the result of local bottom freezing; they are probably due to disturbance of the velocity field. Secondly, profiles are calculated for bay ice shelves. Thickness gradients are largely independent of meltrate or flow parameters but are inversely proportional to the width of the bay. Data from antarctic ice shelves agree with this result both qualitatively and quantitatively. The theory is readily extended to ice shelves in diverging and converging bays. An ice shelf in a diverging bay can only remain intact if it is thick enough and slow enough to creep sufficiently rapidly in the transverse direction. If it cannot, it will develop major rifts or will come adrift from the bay walls. It is then likely to break up. The presence of ice rises or areas of grounding towards the seaward margin can radically alter the size of the ice shelf which can form. The theory could be used as a starting point to study non-equilibrium behaviour. (Auth.)

Iceberg towing.

The potential of towing icebergs to arid regions in the Southern Hemisphere is reviewed. Formidable technical problems exist, some proposed solutions are listed. However, very little has been done to test the technology proposed. Towing, insulation, routes, and other aspects of iceberg-towing technology should be investigated by a trial tow to Western Australia, the area most favorably located for southern iceberg delivery.

Pennisura.

People surveys are presented of four ice rises on the east coast of the Antarctic Pennisula. On Butler Island velocity measurements were also made. The ice rises behave as miniature ice caps frazien to flat horizontal bedrock and provide a simple system for the study of law of ice flow. Deformation is principal. caps frozen to flat horiz intal bedrock and provide a simple system for the study of law of ice flow. Deformation is principally by shear through the ice mass. Each ice rise is bounded on one side by ice shelf and on the other side by open sea. Inwards open sea the profiles are found to agree well with steady-state theoretical profiles. Towards ice shelf the profiles are clongated, and they deviate from the theoretical profiles may be due to compressive stress in the ice shelf, causing migration of the grounding line down sloping bedrock. No significantly anomalous behaviour is found in the summit region (Auth mod.) (Auth mod )

Ice creep, Ice mechanics, Geothermy, Heat transfer, Velocity, Recrystallization.

Velocity, Recrystallization.

Measurements of ice velocity, thickness, and surface topography on the large ice rise known as Rousevelt Island are consistent with Glen's flow law. Assuming that near the center of the ice rise, where the effects of recrystallization are probably negligible, the ice behaves in the same way as randomly-oriented polycrystalline ice, then the geothermal flux G in this area is appreximately 0.06 W/sq m. In the absence of measurements of deep-ice temperatures, the distribution of G across the ice rise cannot be determined. However, the simplest interpretation of the movement data requires (1) a linear increase in G from 0.05 W/sq m on the north-cast side of Rousevelt Island to 0.07 W/sq m in the south-west, and (2) strain-rate enhancement, due to recrystallization, that increases outward from the center of the ice rise to reach a maximum value of approximately two near the edges. The calculated values of G are larger than the world average, but this is consistent with the probably grantice core beneath Roosevelt Island. An increase in G of 0.02 W/sq m in a distance of 600 km would require an increase in grantic thickness of about 5 km. (Auth. mod.) 34-3798 34-3798

Thermohydrodynamic model of an ice sheet.

ematical models. The purpose of this paper is to consider an ice-sheet model based on joint solution to the dynamic equations and equations of heat conductivity in which the surface relief is one of the inkinon functions. The proposed model is applicable to calculation of the antaretic ice sheet. Results of a numerical experiment for present values of the temperature of the ice surface and precipitation, as well as for their separate and simultaneous increase by 2, 4, or 6 deg and 10, 20 or 30%, are given. . have in this order

The microwave emission from a half-space medium, characterized by coordinate dependent scattering and absorbing centers, has been calculated by numerically solving the radiative transfer equation by the method of invariant imbedding. A Mic scattering phase function and surface polarization have been included in the calculation. Also included are the physical temperature profile and the temperature variation of the index of refraction for ice. Using published values of grain-size and temperature profile and the temperature variation of the index of refraction for ice. Using published values of grain-size and temperature-profile data of polar firn, the brightness temperature has been calculated for the 1.55 cm and 0.8 cm wavelengths. For selected regions in Greenland and Antarctica, the results of our calculations are in reasonable agreement with the observed Nimbus-5 and Nimbus-6 EMSR data. (Auth.) A dynamic constitutive law is used to study the response of medium-density snow to shock waves. The results show good correlation between theory and caperiment, except for low-intensity shocks which produce small permanent density changes. In this case the validity of the data is questioned, although further experimental work is needed to settle this question. The results of this work also partially explain why snow so effective in absorbing energy associated with stress waves. This is tell to be due to the work-hardening characteristics of

Floating ice, Ice temperature, Theories.

An approximate calculation is made of the rate which a bottom crevases in a cold ice shelf or tabular iceberg can close shut by freezing of water and can creep open through the creep deformation of ice. In all but the thickest ice shelves and iceberg, those with a thickness greater than about 400 m, the freezing process is the more important mechanism if the ice is cold (<-10C). Consequently, in a cold iceberg or ice shelf, a bottom crevasse, once formed, will freeze shut. Results of the calculation are applicable to the computation of the expected disease. culation are applicable to the computation of the expected disintegration of towed icebergs. (Auth. mod.)

Tests.

This paper presents the construction procedure, data and analysis from an experimental field program to determine the rippability and compaction characteristics of frozen soil. Also investigated was the stability upon thawing of the frozen soil compacted in the field. From the results of the experimental program, several important conclusions concerning winter earthwork were obtained. 1) Ripping frozen soil can be accomplished with heavy equipment which will produce a large range of chunk sizes. 2) The effectiveness of field compaction of frozen material is highly dependent on the moisture content of the soils. 3) The magnitude of settlement in embankiments constructed of frozen material is closely related to the compacted dry density of the placed soil.

Radio-echo sounding in the Allan Hills, Antarctica, in

Radio-ecno sounding in the Alian Hills, Antarctica, in support of the meteorite field program. Kovacs, A., U.S. Army Cold Regions Research and Engineering Laboratory, May 1980, SR 80-23, 9p., ADA-086 858, 3 refs.

veys, Ice cover thickness, Pollution, Meteorites, Antarctica-Allan Hills.

tarctica—Alfan Hills.
Radio-echo sounding measurements made on Ross Island and in the Alfan Hills, Antarctica, indicate that radio-echo sounding may offer the unique possibility of detecting a buried meteorite in glacial ice. The results also revealed internal layering within the snow on Ross Island and in the snow filling an ice depression west of Alfan Nunatak. Radio-echo sounding also gave the depth to bedrock near the west side of Alfan Nunatak. The greatest ice depth measured was 310 m.

The "Toros" device makes possible the mapping of the ice sheet The "Toros" device makes possible the mapping of the ice sheet of extensive areas of the sea at any time of year, regardless of meteorological or lighting conditions. The enumerated data, provided by the "Toros" peripheral scanning radar station, indicate the multitudinous possibilities of applying this data in the solution of problems of various types. With the help of this system, an experiment was conducted in the southeastern part of the Barents Sea in Apr. 1974, which was directed towards the solution of the problem of short-term forceasting of the location of the ice in a given area.

Ice sheets, Ice structure, Glacial geology, Geomorphology, Antarctics—Antarctic Peninsula.

The West Antarctic ice sheet is believed to be inherently unstable because much off it is grounded below sea level. It has been suggested that the uce sheet has withdrawn from its late Wisconsin maximum position, grounded at the edge of the continental shelf, and is now undergoing collapse as a delayed response to the warming and sea-level rise of the Holocene, and that the ice sheet is likely to collapse shortly in response to rising CO2 levels in the atmosphere. The authors present some geomorphological evidence from Alexander Island and the Antarctic Peninsula which does not agree with either hypothesis. Peninsula which does not agree with either hypothesis. Rather, following deglaciation from the Wisconsin maximum, there was less ice than at present around 8,000 yr ago. The ice shelf in George VI Sound has built up subsequently. (Auth.)

the same of the laboration and all as we willow.

16(2), MP 1307, p.314-318, 16 refs.
Soil water migration, Soil physics, Boundary value problems, Seepage, Porous materials, Wettability.

Traditionally, in hydrology and soil physics, weiting fronts appearing in porous media described by Darcy's law have not generally been considered to be singular surfaces. Some recent results from functional analysis are presented as evidence supporting the viewpoint that weiting fronts with a finite propagating speed generally are singular surfaces.

Water movement in a land treatment system of was-tewater by overland flow.

Nakano, Y., et al. Progress in water technolog), 1979, 11(4-5), MP 1285, p.185-206, 15 refs. Khalid, R.A., Partick, W.H., Jr. Water flow, Waste treatment, Water treatment, Soil water, Saturation, Seepage, Slope orientation, Ex-

Water movement in an overland-flow land treatment system Water movement in an overland-flow land treatment system was studied experimentally and theoretically. A small-scale physical model was used to obtain experimental data. The theoretical analysis was based upon the shallow water equation for overland flow and the Darcy-Richards law for soil water flow. It was found that the water movement in the system was primarily, controlled by the application rate, the friction slope, the slope angle, the hydraulic characteristics of soils, and the evapotranspiration. An approximate analytical solution to steady flow in the system was obtained. It was found that the rate of soil water flow was mainly determined by the saturated conductivity of soils and in less extent by the friction slope and the slope angle in the steady condition. A finite difference solution to non-steady flow was found satisfactory in simulating the experimental data.

ace crystal size, 10e cores, Climatic changes.

Crystal size measurements were performed along a 905-m-long ice core obtained from east central Antarctica (Dome C). The expected increase of crystal size with age is observed in the ice deposited during the Holocene: further down major changes appear to be associated with climatic events and, in particular, with the transition from the last glacial age to present conditions. Physical mechanisms which may explain these data are discussed. A tentative estimation of the age of the deep ice is made from the ice crystal growth law. (Auth.)

Glaciological studies by Landsat imagery of perimeter

of Dronning Maud Land, Antarctica.
Orheim, O., Oslo. Norsk polarinstitutt. Skrifter, 1978, No.169, p.69-80, 7 refs.
Sea ice, Ice shelves, Icebergs, Spacecraft, Photointer-

pretation.

The investigation has utilized Landsat imagery to analyze changes in the Dronning Maud Land coastline between 10w and 20E and to obtain statistical data on ocean dynamics, and sea ice and iceberg distribution in this region of the Antarctic.

The imagery for the investigation was provided by National Aeronautics and Space Administration (NASA), USA. Altogether 67 images were received, mostly from the 1975/76 austral summer. Band MSS 7 has been found most useful for the ice studies. The other bands were also used to attempt difthe ice studies. The other bands were also used to attempt dif-ferentiation between ice floes and icebergs, but with inconclu-sive results. The best method to distinguish between the ice shelf edge and the fast ice, and to bring out ice rises on the ice shelf, has been to copy the MSS 7 negatives at 5-10 times < normal > exposure (Auth)

Snow accumulation and snow stratigraphy on Riiser-Larsenisen, Dronning Maud Land, Antarctica.

Repp, K., Oslo. Norsk polarinstitutt. Skrifter, 1978, No. 169, p.81-92, 7 refs.

Show accumulation, Snow physics, Snow stratigraphy, Antarctica—Queen Maud Land.

The western part of Riser-Larsenisen is fairly flat, with small

undulations difficult to detect. Outstanding features are an ice dome of 200 metres elevation and a long, narrow depression parallel to the edge of the ice shelf. Snow stratigraphy and density were measured in nine pits, the deepest 4.5 metres. Mean accumulation of all pits for the year 1976 was 588 mm in water equivalent, which is higher than earlier investigations. Five snow cores to depths of 11 to 15 metres were collected for laboratory analyses. (Auth.) undulations difficult to detect. Outstanding features are an ice

Frost action, Frost heave, Ice needles, Soil water mi-

gration, Soil tests.

A method is described for convenient study of frost action, including soil heaving and needle ice formation. The apparatus is simple and small and the procedure requires only 25 cu cm soil specimens. The method could be useful for screening either large numbers or limited quantities of soils or soil additives for frost susceptibility. The method described was used to perform a limited number of tests with several soils. The tests obtained action in the form of soil heave, ice heave, or ice needles, yielding maximum heights up to three to six times the initial 40-mm soil depth. Maximum growth rates were up to 1 to 3 mm/th for soil heaves and 3 to 7 or more mm/h for ice heaves and ice needles. Initial trials showed that thickner additives and possibly other treatments can restrict frost action. A method is described for convenient study of frost action frost action

essing.

The authors review the current state of the management of ice core data as data collecting has expanded with the establishment of large scale national and international programs. With the expansion have come problems such as data exchanging, advisability of having a central data base, data formats and standards, and defining archivable data. Future possibilities for data centers are explored.

This paper reports the status of past and present ice core investi-gations, documentation of core sites, the groups carrently in-solved in ice core drilling, the principal centers conducting ongoing ice core analyses, and the availability of cores and data for Arctic Canada, Greenland, temperate ice zones and Antarctica.

Ice core information storage and exchange system. Thompson, J.M., et al, *Glaciological data*, May 1980, GD-8, p.59-63.

MacKinnon, P.K.

Ice cores, Data processing.

Ice cores, Data processing.

This paper presents an overview of a data and information storage and exchange system (DISES) developed by the World Data Center A for Glaciology for the management of ice core and related data. The design of this system consists of specifications for the data file structure, the computer programs necessary to obtain the proposed operational capabilities, and procedures to use the programs and data files within the host computer facility. Elements of this design have been shaped by the nature of ice core data sets and by suggestions received from the glaciological community. (Auth)

Central ice core storage facility-ice core sampling procedures. U.S. National Science Foundation. Division of Polar Programs, *Glaciological data*, May 1980, GD-8, p.66-

Ice cores. Cold storage.

ace cores, Cold Storage.

Procedures and criteria are outlined by which researchers may have access to the ice cores stored by NSF's Ice Core Storage Facility. The curator of the facility, following discussions of a project with a researcher makes recommendations to the Chief Scientist. NSF, who approves or disapproves the use of core samples. If approval is given, the curator distributes the samples.

34-4026

Specimen and core-sample distribution policy. U.S. National Science Foundation. Division of Polar Programs, Glaciological data, May 1980, GD-8, p.69-

Ice cores. Drill core analysis.

Given here are general policies and procedures established by NSF as to how ice and sediment cores under its authority will be distributed among qualified researchers. Contact addresses and telephone numbers are listed for storage facilities and the kind of material stored at each of the four locations is noted. Ice and sediment cores are those retrieved from drilling in Antarctica during Eltanin cruises, RISP, and DVDP

Ice cores, Ice sampling, Research projects, Antarctica. Greenland.

tica, Greenland.

Before fine details of ice core records can be accepted as significant, it will be mecessary to compare the features of neighboring cores as a function of their separation. Once the local variability of such features has been established, the way is open to sampling the essential features of najor catchments in the Antarctic and Greenland ice sheets. It is suggested that further deep cores are needed on the Byrd flow line, and on flow lines from Dome C towards Casey and Dumont d'Urville, in the regions of relatively fast flow. Together with the existing core data and improved models, these new data will define the thermodynamics and dynamics of two major Antarctic catchments. Concurrent intermediate and shallow sampling programs are needed to complete the material from which their histories could be reconstructed. The concept of a surface sampling task force is outlined. This would collaborate with aerial radar sounding, deep drilling, and computer modeling teams in a coordinated program for completing the task of describing the polar ice sheets as physical systems. Ice coring drills.

the same of the sa

Ice coring drills.

The report reviews the capabilities and present status of ice drilling equipment developed for use in the Antarctic, Arctic, and other alpine localities. It is limited to a discussion of drilling equipment developed through funding by the NSF-DPP, and currently under the custodianship of the Polar Ice Coring Office. A brief background statement is followed by individual discussions of the seven ice drilling and coring devices currently in the NSF-DPP inventory.

Time-priority studies of deep ice cores. Gow, A.J., Glaciological data, May 1980, GD-8, MP 1308, p.91-102, 18 refs.

Ice cores, Drill core analysis, Antarctica—Byrd Sta-

tion. Both the Greenland and Antarcticines sheets have been successfully core-drilled to bedrock. 1390 m at Camp Century, Greenland in 1966 and 2164 m at Byrd Station, Antarctica in 1968. Core and borehole studies at both sites have revealed a wealth of interesting results, especially at Byrd Station where extensive studies of cores were begun as soon as they were pulled out of the drill hole. Continuing investigations of these Byrd Station drill cores, including recent observations of apparent wide-pread recrystallization in certain sections of a paparent wide-pread recrystallization in certain sections of one core, further confirm the importance of initiating as many studies as possible at the drill site. Any list of the studies that should be conducted on deep ice cores must recognize two kinds of research. I) those studies of a time-priority nature that must be initiated as soon as cores are pulled to the surface and, 2) other essential studies in which relaxation of the ice is not a factor. These later studies can generally be deferred until cores are transported to more permanent storage facilities outside Antarctica (Auth mod.).

Ice core work at the Laboratoire de Glaciologie, CNRS, Grenoble.

Raynaud, D., Glaviological data, May 1980, GD-8, p.103-107, 14 refs.

Ice cores, Drill core analysis, Laboratories.

The Laboratoire de Glaciologie is dedicated to environmental action. The work done by the Grenoble laboratory includes the recovery and analysis of ice cores in order to obtain a record of past environmental conditions that prevailed near the surface of ice masses. For this purpose the best conditions have been found on polar ice sheets where large areas are unaffected by surface melting and ice thicknesses provide long time series. Much of the field work has been done in Antarctica, where cores were drawn for climate and atmospheric composition studies. (Auth mod.)

21486 or 33-3204. 10 refs. Tesis, R.V., Kiselevskii, M.A., Kochetkova, S.N Snow composition, Isotope analysis, Oxygen isotopes, Antarctica—East Antarctica.

topes, Antarctica—East Antarctica.

Oxygen-isotope compositions have been determined for snow-cover specimens from five areas between the Mirnyy and Pionerskaya stations in East Antarctica—The height increases away from the coast, while the mean air temperature falls, and his is accompanied by a fall in delta-18-O. In the coastal zone (less than 50 km from Minnyy, height less than 0.86 km, air in the oxygen-isotope composition. Further from the coast, between 50 and 353 km, the variation in delta-18-O with temperature amounts to 0.6% per degree. These variations in delta-18-O in the annual layers include effects crising from the details of the formation at the sampling points, so the data cannot be used directly to trace the temperature variations from year to year. The spatial nonuniformity in the snow deposition also results in considerable nonuniformity in the isotope composition for specimens taken within a restricted area. (Auth.)

This study was conducted to determine both the short- and long-term effects of spills of hot Prudhoe Bay crude oil on permafrost terrain in subarctic interior Alaska. Two experimental oil spills of 7570 liters (2000 gallons) each on 500 sq m

test plots were made at a forest site underlain by permaffost near Fairbanks, Alaska. The oil spills, one in winter and one in summer, were conducted to evaluate their effect during these two seasonal extremes. Oil movement, thermal regime, hotanical effects, microbiological responses, permafrost impact, and composition of the oil in the soil were monitored for two vears

Bulletin.

Jan. 1980, No.49, p.21-32, 25 rcfs.
Glacial geology, Patterned ground, Cirques, Glacier ice, Antarctica—Black Coast.

ice, Antarctica—Black Coast.

The physiography and glacial geomorphology of the central Black Coast, Palmer Land, are described. Weathering processes are discussed in relation to the widespread disintegration of the bedrock. A comprehensive account of differentially croded forms is given, and some evidence is put forward supporting theories as to the origin and development of cavernous weathering. Some small-scale patterned ground features are recorded with suggested processes of formation in the antarctic environment. The occurrence of ubiquitous glacial erratics and three supraglacial moraines is noted. (Auth.)

Geologic structures, Topographic features, Ice cover, Antarctica—Palmer Land.

The physiography and glaciation of part of northeastern Palmer Land are described and the controls affecting these factors are discussed. In particular, the striking differences between the respective topographies of Graham and Palmer Lands are noted, and evidence for the recession of the Palmer Land ice cap is presented (Auth.)

Sea ice, Drift, Tides, Antarctica—Argentine Islands, Antarctica—George VI Sound.

Antarctica—George VI Sound.

The results of tidal analysis of 9 years of sea level records from the Argentine Islands and short records of ice movement from lake sites in George VI Sound are presented. Diurnal tides are normal throughout, but the semi-diurnals show a sharply tuned anti-resonance, most noticeably affecting M2. The Argentine Islands have the unusual property that their tides can nearly vanish near May 2 and Nov. 2. Tidal amplitude of sea level there is significantly lower than that of ice movement recorded in 1935. Tidal ice movement in George VI Sound appears to be quite variable in amplitude and phase. The most reliable and consistent ice record was from Ablation Lake, whose results are similar to those from older ice records at Barry Island in Marguerite Bay. Comparison of Ablation Lake with another site 60 km to the southeast shows that tidal phases increase southward in George VI Sound. (Auth.)

Gravity connections to Vostok have been made through two routes, one from Mirnyy and the other from McMurdo. These trees are of general interest for gravimentric studies in Antarctica, because they provide a direct airborne link between the stations upon which two major gravitational networks (American and Soviet) are based. These ties are examined in some detail. (Auth)

Kurtz, D.D., Domack, E.W., Balshaw, K.M.

Marine geology, Glacial deposits, Sediments, Ice shelves, Cores, Ross Sea, Weddell Sea, Antarctica— Ross Sea.

Ross Sea.

Continental shelf deposits recently cored in the Weddell Sea. Ross Sea, and the George V region of Antarctica show three types of sediment. Type 1 sediments are massive, poorly sorted, and textually and mineralog.cally homogeneous down-core; they are unfossiliferous or cortain reworked fossils, lack a preferred pebble orientation, and are overcompacted. They are interpreted as being basal tills. Type 2 sediments are crudely stratified, contain a sorted mud fraction, are texturally and mineralogically heterogeneous downcore, contain distinctive microfossil assemblages, are typically normally compacted, and have a horizontal pebble fabric. Type 3 sediments are similar to Type 2 sediments except that they are depleted in silt and clay and contain a moderately sorted sand fraction. Both Type 2 and Type 3 sediments are deposited from floating ice and reflect the action of marine currents. Distributions of these deposits on the antarctic continental shelf can be related to former glaciologic and marine conditions. (Auth. mod.) 34-4190 34-4190

Snow melting, Snow erosion, Channels (waterways), Meltwater, South Shetland Islands.

This paper re-examines the geomorphological role of meltwater derived from snow patches in the light of observations made

during the break up of snow cover on Byers Peninsula in 1976. The object is to draw attention to the erosive capacity of snow melt and the fact that channels created by this action can show similar morphological characteristics to those commonly as-cribed to a fluvioglacial origin. These include the crossing of local topographic divides and commencement in the middle of slopes. (Auth.)

Jenkins, T.F., et al, Journal of environmental science and health: Part A. Environmental science and engi-neering, 1980, A15(3), MP 1313, p.211-224, 14 refs. Leggett, D.C., Martel, C.J.

Waste treatment, Water treatment, Waste disposal, Vaporizing.

Vaporizing.

A prototype overland flow land treatment system was studied to determine its effectiveness in reducing the levels of volatile trace organics in municipal wastewater. Chlorinated pi mary wastewater, water collected from the surface at various points downslope and runoff were analyzed by GC/MS, using a purge and trap sampler. Results indicated that efficient removal of a number of volatile substances including chloroform and toluene can be achieved by this method of treatment. Loss of these substances was found to follow first order kinetics. The observed behavior is consistent with a volatilization process.

In 1977, DEW Line station DYE-3 on the Greenland Ice Cap was moved sideways 210 ft (64 m) onto a new undistorted foundation. When this life extension concept was proposed, abrupt failure of the supporting snow was a major concern. Snow samples were obtained and strength tested at CRREL to determine the chance of an abrupt failure of the supporting

snow. Model studies were also performed to determine the bearing capacity of the snow, and predictions were made of foundation settlement during the move. The results indicated that the move could be accomplished safely

Possible relationships between changes in global ice volume, geomagnetic excursions, and the eccentricity of the Earth's orbit.

Rampino, M.R., Geology, Dec. 1979, 7(12), p.584-

Ice volume.

Lee volume.

A possible relationship between major changes in global ice volume, geomagnetic variations, and short-term climate cooling has been investigated through a study of climate and geomagnetic records of the past 400,000 yr. Calculations suggest that redistribution of the Earth's water mass can cause rotational instabilities that lead to magnetic excursions; these magnetic variations in turn may lead to rapid coolings through several proposed mechanisms. Such double coincidences of magnetic excursions and sudden cooling and glacial advance at times of major ice-volume changes have occurred at about 13,500, 30,000, 110,000, and 180,000 B.P. The last four and possibly five times of maximum eccentricity of the Earth's orbit were closely followed by magnetic excursions; catastrophic cooling and rapid ice buildup accompanied several of these excursions. Thus, Milankovitch cycle parameters may lead to glaciation through both insolation changes and geomagnetic effects on climate. Although most of the supporting evidence for the hypothesis is taken from Northern Hemisphere events, coinciding sea temperature declines and extinction of a diaton in sub-Antarctic regions provide further supporting evidence. regions provide further supporting evidence.

National Environmental Satellite Service catalog of

National Environmental Satellite Service catalog of products, third edition.

Dismachek, D.C., comp, U.S. National Oceanic and Atmospheric Administration. Technical memorandum, Apr. 1980, NESS 109, 120p., For the 1977 edition see 32-24. 30 refs.

Booth, A.L., comp, Leese, J.A., comp.

Remote sensing, Spacecraft, Data processing.

This volume describes all the currently available operational products of the National Environmental Satellite Service (NESS). It is an update of the (1977) National Environmental Satellite Service Catalog of Products. A Product is defined

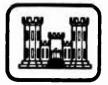

as any item routinely produced and available for applications within the environmental sciences. These range from photographic displays, chasts, and teletype messages to the raw alphanumeric data available on computer disk and tape. A brief description of the product, its known accuracies (when applicable), a list of primary users, and an example of the product are given; a summary table of products can be found at the end of this volume for quick reference. Data for Antarctica, derived almost exclusively from satellite observations, and sea ice charts for the Southern Oceans are included among NESS products.

**VOLUME 34, Part 2** 

Geza T. Thuronyi, Editor

December 1980

# NOTE

This is a companion issue to Vol. 34, Pt.1. The latter contains the full bibliographic citations referred to in the author and subject indexes included in this issue. In the author index principal and joint personal and corporate authors are listed along with the title, date, pagination, and language of the document and the accession number. The subject index is composed of three basic elements: 1) terms taken from a controlled vocabulary based on the *Thesaurus of Engineering and Scientific Terms* (LEX-E-JC), 2) free terms added as needed, 3) geographic names, generally entered under countries. The terms are listed in a single alphabetical arrangement, along with title (original, translated, abridged, expanded, or supplied), principal author, date, pagination, and language of pertinent documents, and their accession numbers.

When ordering this publication, both Parts 1 and 2 should be ordered, as they are complementary.
